1 ~~1~~ Introduction

The Report Definition Language (RDL) file format is the file format for Microsoft SQL Server RDL, a file type that is used to represent the metadata for defining a **report**.

Sections 1.7 and 2 of this specification are normative ~~and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119.~~. All other sections and examples in this specification are informative.

1.1 ~~1.1~~ Glossary

~~The~~ This document uses the following terms ~~are defined in [MS-GLOS]~~:

~~chart data region~~
~~list data region~~
~~matrix data region~~
~~report definition~~

~~The following terms are specific to this document:~~

~~**absolute path:** A string that specifies the full folder path (such as "/salesreports/orderdetails") or full URL (such as "http://reportserver/reports/sales/orderdetails").~~

absolute path: A string that identifies the location of a file and that begins with a drive identifier and root directory or network share and ends with the complete file name. Examples are C:\Documents\Work\example.txt and \\netshare\Documents\Work\example.txt.

action: An interactivity event in a report, such as a hyperlink, bookmark link, or drillthrough link, that is associated with an item in a report.

aggregate function: A function that returns a single value by summarizing data. RDL specifies the following standard aggregate functions: Sum, Avg, Max, Min, Count, CountDistinct, CountRows, StDev, StDevP, Var, and VarP. In addition, RDL specifies the following advanced aggregate functions: First, Last, Previous, RunningValue, RowNumber, and Aggregate~~. For more information, see Aggregate Functions~~.

~~**anti-aliasing:** A method of removing distortion from visual elements in a **report** to make them appear smoother.~~

anti-aliasing: The smoothing of the jagged appearance of font characters and lines, which is an artifact of the limited resolution on an output device. The pixels that surround the edges of the character glyph or line are changed to varying shades of color in order to blend the sharp edge into the background.

band sheet: A page in a band. A band can have more than one sheet.

bookmark: An anchor that is used in a ~~client user interface~~ report to assist navigation, typically through the use of hyperlinks. A bookmark link in a report sends the user to another ~~place within~~location in the report.

border skin: The appearance of the border that is drawn around a **chart** or map.

chart: An object that displays data or the relationships between sets of data in a visual form.

~~1.3 Overview~~

1.3 Overview

This document specifies the file format for RDL, a file type that is used to represent the metadata for defining a report. A **report definition** file is an XML file, as specified in [XML10/5].

~~1.1.2~~1.3.1 ~~1.3.1~~ Report Definition Language File Content

SQL Server Report Definition Language (RDL) consists primarily of the following kinds of information:

- **Report data**: Instructions about how to obtain the data to display in the report (such as a connection string and **query**), along with information about the structure of that data (such as field names).
- **Calculations**: Calculations and transformations to be performed on the report data, including grouping, sorting, filtering, aggregations, and scalar formulas.
- **Report layout**: Instructions about how to structure, format, and present the data and calculations in the resulting report. This also includes information about the kinds of end-user interactivity to make available in the report.

~~1.1.3~~1.3.2 ~~1.3.2~~ Report Rendering

RDL is output format-neutral. This means that reports that are defined by using RDL can be output or rendered to a variety of formats including web-ready and print-ready formats or data-focused formats such as XML.

RDL itself is not narrowly prescriptive with respect to the output that results from rendering a report. When generating different output formats, products may represent RDL constructs slightly differently or ignore certain constructs completely. For example, a product that generates a textual format may choose to ignore **images** in the report.

~~1.1.4~~1.3.3 ~~1.3.3~~ Document Structure

The root element of an RDL document is the Report element.

Subelements are order-independent. This includes items in collection elements, unless the collection is explicitly defined as an ordered **list**.

Unless otherwise specified, a subelement may occur once at most as a child of its parent element. A collection may have multiple instances of a subelement. This will be explicitly stated.

White space is not trimmed from values in the RDL document.

~~1.1.4.1~~1.3.3.1 ~~1.3.3.1~~ XML Namespace

The namespace URI for RDL is as follows:

Copyright © 2016 Microsoft Corporation

http://schemas.microsoft.com/sqlserver/reporting/yyyy/mm/reportdefinition

The date component (yyyy/mm) indicates the date of the release of that version of RDL. The date component is used throughout this document to identify one of the following specific versions of RDL:

- 2003/10 [MSFT-RDL200310]
- 2005/01 [MSFT-RDL200501]
- 2008/01 [MSFT-RDL200801]
- 2010/01 [MSFT-RDL201001]
- 2011/01 [MSFT-RDL201101]
- 2012/01 [MSFT-RDL201201]
- 2013/01 [MSFT-RDL201301]
- 2016/01 [MSFT-RDL201601]

The standard file name extension for RDL files are .rdl and .rdlx.

The **MIME type** to use for RDL files is text/xml.

~~1.3.4 Report Definition Overview Diagrams~~

1.3.4 Report Definition Overview Diagrams

This section contains diagrams that illustrate the schema of the 2010/01 [MSFT-RDL201001] version of Report Definition Language.

Note that for simplicity, certain related types are represented in the diagrams as abstract base types. For example, the abstract base type **ReportItem** does not appear in RDL. Only concrete derived types (such as **Textbox**) appear in RDL. The following are the abstract base types that are shown in the diagrams: **ReportItem**, **DataRegion**, **Gauge**, **GaugeScale**, and **GaugePointer**.

~~1.2~~1.4 ~~1.4~~ Relationship to Protocols and Other Structures

RDL is used as a payload in the following protocols:

- ~~—~~ReportExecution2005 [MS-RSWSRE2005]: Used when setting the definition of a report for execution.

Copyright © 2016 Microsoft Corporation

- ~~ReportService2005~~ [MS-RSWSRMNM2005]: Used when setting or retrieving the definition of a report in the report catalog.
- ~~ReportService2006~~ [MS-RSWSRMSM2006]: Used when setting or retrieving the definition of a report in the report catalog.

RDL references structures that are defined in [MS-RDLRS].

~~1.3~~1.5 ~~1.5~~ Applicability Statement

This persistence format is applicable for use as a standalone representation of report metadata and for publishing report metadata from a client to a server.

~~1.4~~1.6 ~~1.6~~ Versioning and Localization

This document specifies the structures for the following versions of RDL:<1>

- ~~2003/10~~ [MSFT-RDL200310]
- ~~2005/01~~ [MSFT-RDL200501]
- ~~2008/01~~ [MSFT-RDL200801]
- ~~2010/01~~ [MSFT-RDL201001]
- ~~2011/01~~ [MSFT-RDL201101]
- ~~2012/01~~ [MSFT-RDL201201]
- ~~2013/01~~ [MSFT-RDL201301]
- 2016/01 [MSFT-RDL201601]

These versions are defined in Appendix A: RDL XML Schemas (section 5).

There are no localization-dependent structures in the RDL file format.

~~1.7 Vendor-Extensible Fields~~

1.7 Vendor-Extensible Fields

RDL is an open schema. Application authors may extend and annotate RDL with their own attributes and subelements (in their own namespace). Note, however, that tools that use RDL may validate the extended namespaces~~,<2>,~~ but do not have to preserve unrecognized elements when loading and persisting. For properties that must be preserved independent of the tool, the CustomProperties element should be used instead.

2 ~~2~~ Structures

2.1 ~~2.1~~ Introduction

As an XML file that conforms to an XML schema, RDL is comprised of simple and complex elements. RDL has other structural constraints and restrictions, as well, which cannot be expressed fully by an XML schema.

Two facts are critical to interpretation of the XML schema definitions used throughout this document. First: Because of limitations in the XML schema definition language, in some cases, the XML schema definition does not fully constrain the contents of RDL. Some constraints are defined only in the normative textual description of the element. Second: The snippet of the XML schema definition, when taken out of context, can, in some cases, appear to be less restrictive than the normative textual description of the element, even when the full XSD actually matches the normative textual description exactly.

As an example of the second issue, consider the following snippet of XSD.

```
<xsd:element name="Child1" type="xsd:string" />
```

Based on this line, it would appear **Child1** is mandatory.

However, the full context of the usage of **Child1** might be the following.

```
<xsd:complexType name="Parent">
       <xsd:choice minOccurs="1" maxOccurs="unbounded">
              <xsd:element name="Child1" type="xsd:string" />
              <xsd:element name="Child2" type="xsd:string" />
       </xsd:choice>
</xsd:complexType>
```

Based on the xsd:choice, **Parent** must have at least ~~1~~one child, but **Child1** itself is not actually mandatory.

This section describes the elements defined in the RDL, describing the meaning, restrictions, and constraints of each element and its value, if applicable; the relationships between the element and others; and the XML schema definition of the element.

The RDL XML file is a valid XML file, as specified in [XML10/5], which conforms to one of the XSD specifications defined in section 1.3.3.1 of this document, depending on the RDL version. Section 5 of this document describes the structures of an RDL XML file that conforms to this specification.

2.2 ~~2.2~~ Common RDL Types

~~2.2.1 String~~

2.2.1 String

If the RDL format specifies an element or attribute as type **String**, it MUST be a valid **UNICODE** string, as specified in [XMLSCHEMA2] section 3.2.1 for **xsd:string**. Unless the value is explicitly specified (such as when the element or attribute is not present), its value is interpreted as a **null value**.

Copyright © 2016 Microsoft Corporation

~~2.2.2 Integer~~

2.2.2 Integer

If the RDL format specifies an element or attribute as type **Integer**, it MUST be a valid **int** value, as specified in [XMLSCHEMA2] section 3.3.17 for **xsd:int**. A valid **int** value MUST be greater than -2147483649 and MUST be less than 2147483648.

~~2.2.3 Boolean~~

2.2.3 Boolean

If the RDL format specifies an element or attribute as type **Boolean**, it MUST be a valid **Boolean** value, as specified in [XMLSCHEMA2] section 3.2.2 for **xsd:Boolean**.

~~2.2.4 Float~~

2.2.4 Float

If the RDL format specifies an element or attribute as type **Float**, it MUST be a valid IEEE single-precision 32-bit floating point type [IEEE754], as specified in [XMLSCHEMA2] section 3.2.4 for **xsd:float**.

~~2.2.5 DateTime~~

2.2.5 DateTime

If the RDL format specifies an element or attribute as type **DateTime**, it MUST be a valid date and time-of-day value as specified in [ISO8601] and in [XMLSCHEMA2] section 3.2.7 for **xsd:datetime**.

~~2.2.1~~2.2.6 ~~2.2.6~~ NormalizedString Elements and Attributes

The RDL format specifies a number of elements and attributes in the XSD structure as **xsd:NormalizedString**. This enforces further restrictions on the identifier string values for these elements and attributes.

Unless explicitly specified otherwise, when the value of an element or attribute is **xsd:NormalizedString**, the file format validation implementation of RDL schema versions 2003/10 [MSFT-RDL200310], 2005/01 [MSFT-RDL200501], 2008/01 [MSFT-RDL200801], ~~and~~ 2010/01 [MSFT-RDL201001], and 2016/01 [MSFT-RDL201601] specifies that every **xsd:NormalizedString** identifier MUST be:

- ~~•~~ Unique within the entire report.
- ~~•~~ A **CLS-compliant identifier** [UTR15] name.

Additionally, RDL schema versions 2008/01 [MSFT-RDL200801~~] and~~], 2010/01 [MSFT-RDL201001], and 2016/01 [MSFT-RDL201601] further restrict the maximum length of identifiers to 256 characters.

Elements whose value must be **xsd:NormalizedString** can be referenced by the following elements and attributes.

~~2.2.7 RdlSize~~

2.2.7 RdlSize

This simple type specifies restrictions for a valid size string value or expression.

Elements of the **RdlSize** type MUST be in the following structure:

```
"<FormatValue><FormatType>"
```

The **FormatValue** property MUST have a numerical string value in the form of an Integer ([XMLSCHEMA2] section 3.3.17) with no thousand delimiters, optionally followed by a decimal point and a positive integer. Unless otherwise specified, the value of the **FormatValue** property MUST NOT evaluate to a negative **Integer** or Float ([XMLSCHEMA2] section 3.2.4) string.

The **FormatType** property specifies the unit type that is used for the distance.<~~31~~32> This property MUST be set to one of the following:

Copyright © 2016 Microsoft Corporation

pt: Specifies a size in units of points.

pc: Specifies a size in units of picas.

in: Specifies a size in units of inches.

mm: Specifies a size in units of millimeters.

cm: Specifies a size in units of centimeters.

Unless otherwise specified, if an element that is of type **RdlSize** is not present, the value of the element is interpreted as

```
"0<FormatType>"
```

where <*FormatType*> is defined above.

A negative **RdlSize** is an **RdlSize** in the format of <*value*><*unit*> where *value* is a negative value

The **UserSort.SortExpression** element specifies an expression on which to sort. This element MUST be specified. Its value MUST be a String ([XMLSCHEMA2] section 3.2.1) or an expression that evaluates to a variant.

The same restrictions that applied to Filter.FilterExpression instances within a Group MUST also apply to this element. If the expression that this element specifies contains an **aggregate function**, the aggregate function MUST have a **scope** that is equal to or that contains the value of UserSort.SortExpressionScope. The **UserSort.SortExpressionScope** element specifies the name of the scope (data region or Group) in which to evaluate the UserSort.SortExpression. The **UserSort.SortExpressionScope** element is optional.

If the **UserSort.SortExpressionScope** element is specified, its value MUST be a String ([XMLSCHEMA2] section 3.2.1). If this element is not present, the sort expression will be evaluated and the sort will be performed independently in each **detail scope** within the sort target.

The value of the **UserSort.SortExpressionScope** element MUST be equal to or contained within the current scope. If the containing Textbox has no current scope (for example, the text box is not contained within any data region or **Group**), the value of this element MUST be equal to or contained within the scope that is defined by the peer UserSort.SortTarget element.

The value of the **UserSort.SortExpressionScope** element MUST NOT evaluate to a detail scope (for example, a **Group** that has no Group.GroupExpressions instance). The DataSet that is associated with **UserSort.SortExpressionScope** MUST be the same as the **DataSet** that is associated with the peer **UserSort.SortTarget** element. Sorting for the UserSort MUST take place within the **Group** that contains the **UserSort.SortExpressionScope**.

The **UserSort.SortTarget** element specifies the name of a data region (Tablix, Chart, GaugePanel, CustomReportItem, List, Table, Matrix), Group, or DataSet to which to apply the sort. This element is optional.

If the **UserSort.SortTarget** element is specified, its value MUST be a String ([XMLSCHEMA2] section 3.2.1) that MUST be the name of the current scope, the name of an ancestor scope, or the name of a peer scope that is a data region. 2.22 ~~2.22~~ Tablix

Applies to RDL schemas 2008/01 [MSFT-RDL200801]~~***and***~~***, 2010/01*** [MSFT-RDL201001]***, and 2016/01*** [MSFT-RDL201601]

The **Tablix** element defines a tablix, which is a layout grid that consists of columns and rows that can optionally be filtered, sorted, grouped, nested, and repeated.

The tablix incorporates the collective functionality of the List, Table, and Matrix that were defined in versions of RDL prior to RDL schema 2008/01 [MSFT-RDL200801].

An element of type **Tablix** MUST NOT be specified within a page header or a page footer.

There are two collections of TablixMember elements. **TablixMember** elements that have a TablixRowHierarchy ancestor in the tablix are called tablix **row members**. **TablixMember** elements that have a TablixColumnHierarchy ancestor in the tablix are called tablix **column members**.

The quantity of TablixColumn elements within the tablix MUST equal the quantity of tablix column members that do not have a **TablixMember** element descendant. The quantity of **TablixColumn** elements within the tablix MUST equal the quantity of TablixCell elements within the tablix.

The value of the Tablix.LayoutDirection element changes the effect that the value of the Tablix.GroupsBeforeRowHeaders element will have. This is described under **Tablix.GroupsBeforeRowHeaders**.

Columns of tablix **row headers** MUST be laid out before columns that are defined by **TablixColumn** elements, and they MUST be considered in conjunction with the **Tablix.GroupsBeforeRowHeaders** element.

The Tablix.TablixCorner element MUST be specified if the following conditions are true:

- ~~•~~ The tablix has a **TablixRowHierarchy** element child that has a TablixHeader element descendant.
- ~~•~~ The tablix has a **TablixColumnHierarchy** element child that has a **TablixHeader** element descendant.

If either the **TablixRowHierarchy** element or the **TablixColumnHierarchy** element does not have a **TablixHeader** element descendant, the **Tablix** element MUST NOT have a child TablixCorner element.

If a TablixCornerRow element is specified, the quantity of descendant TablixCornerCell elements in the tablix MUST equal the quantity of unique cumulative widths for each tablix row member of the tablix. "Cumulative width" for a tablix row member is defined as the sum of the values of all TablixHeader.Size elements that are descendant of the tablix row member.

If a **TablixCorner** element is specified, the quantity of descendant **TablixCornerRow** elements in the tablix MUST equal the quantity of unique cumulative heights for each tablix column member of the tablix. "Cumulative height" for a tablix column member is defined as the sum of the values of all **TablixHeader.Size** elements descendant of the tablix column member.

Borders and any **background images** that are specified under Tablix.Style can be repeated on vertical and horizontal page breaks by using the Tablix.OmitBorderOnPageBreak element.

The informative reference *Understanding Tablix Data Region Areas* [MSDN-UTDRA] is useful to understand the nomenclature of tablix components.

The **TablixMember.DataElementName** element specifies the name to use for a data element of the TablixMember in a data rendering. The **TablixMember.DataElementName** element is optional and MUST NOT be specified more than once.

If the **TablixMember.DataElementName** element is specified, its value MUST be a String ([XMLSCHEMA2] section 3.2.1) that is a CLS-compliant identifier [UTR15] that is unique within the parent data element.

If the parent element is a dynamic member and if the **TablixMember.DataElementName** element is not specified, its value is interpreted as the value of the Group.Name attribute of the Group element sibling concatenated with "_Collection".

If the parent element is a static member and if the **TablixMember.DataElementName** element is not specified, its value is interpreted as the value of the first descendant **TablixMember.DataElementName** element of the parent element's TablixHeader element.

If the value of the **TablixMember.DataElementName** element is not specified and cannot have a viable default, the value of this element is interpreted as "null".

Auto (default): If the parent element is a dynamic member, this value is interpreted as "Output".

Output: The **TablixMember** appears in the data rendering output.

NoOutput: The **TablixMember** does not appear in the data rendering output.

If the parent element is a static member and if the parent element has a TablixHeader element, this value is interpreted as "Output". Otherwise, this value is interpreted as "NoOutput".

Applies to RDL schemas 2003/10 [MSFT-RDL200310] ***and 2005/01*** [MSFT-RDL200501]

The **Matrix** element specifies a grid of regions that repeats with each column group and row group in the rowset. The grid consists of columns and rows that can optionally be filtered, sorted, grouped, nested, and repeated. Matrices provide functionality similar to crosstabs and pivot tables. Unlike a Table, which has a static set of columns, matrix columns can be dynamic.

A matrix has a number of components; these are the corner, **dynamic row** and **static row** group headers, **dynamic column** and **static column** group headers, and detail cells. The corner is a single cell in the upper-left corner. The corner cell can be used to display a label for the matrix or can be left empty. When the report is rendered, dynamic column headers expand right or left for as many columns as there are groups. Dynamic row headers expand down the page. The data that appears in the detail cells are aggregates based on the intersections of columns and rows.

The **ChartSeries** element specifies the list of data points for one series in a ChartArea. If there are multiple **ChartSeries** elements in a **ChartArea** and if these elements have values for ChartSeries.Type and/or ChartSeries.Subtype that cannot be displayed together in the same **ChartArea** (such as a column chart and a pie chart), then the values of the **ChartSeries.Type** and **ChartSeries.Subtype** of the first **ChartSeries** element in the ChartSeriesCollection are used to override the series that has an incompatible type or subtype. For example, if the first chart series type and/or subtype is a column chart, a pie chart will be considered to be a column chart when it appears in the same **ChartArea** as the column chart.

~~2.329.1~~2.334.1 ~~2.330.1~~ Filter.FilterExpression

The **Filter.FilterExpression** element specifies an expression that is evaluated for each instance of a group, or for each row of data that is associated with a DataSet (for RDL schemas 2008/01 [MSFT-RDL200801~~] and~~], 2010/01 [MSFT-RDL201001], and 2016/01 [MSFT-RDL201601]), a group, or a data region. This expression is then compared to the value of the Filter.FilterValues element by using the Filter.Operator element. Failed comparisons MUST result in the row or instance being filtered out of its containing group, dataset, or data region.

The **Filter.FilterExpression** element MUST be specified, and it MUST NOT contain references to report items. If the **Filter.FilterExpression** element is not within a group, its value MUST NOT contain an aggregate function. If this element is within a group, it MUST NOT contain any instances of the RunningValue aggregate function, and it MUST NOT contain any First or Last aggregate functions with anything but the default (current) scope.

The **Filter.Operator** element specifies an operator to use to compare the values of Filter.FilterExpression and FilterValues. The **Filter.Operator** element MUST be specified. The value of this element MUST be a String ([XMLSCHEMA2] section 3.2.1), and it MUST be one of the following:

Equal: Specifies an equality comparison.

Like: Specifies a like comparison (that is, it compares a string against a pattern).

NotEqual: Specifies an inequality comparison.

GreaterThan: Specifies a comparison to determine whether the **Filter.FilterExpression** value is greater than the **FilterValues** values.

GreaterThanOrEqual: Specifies a comparison to determine whether the **Filter.FilterExpression** value is greater than or equal to the **FilterValues** values.

LessThan: Specifies a comparison to determine whether the **Filter.FilterExpression** value is less than the **FilterValues** values.

LessThanOrEqual: Specifies a comparison to determine whether the **Filter.FilterExpression** value is less than or equal to the **FilterValues** values.

TopN: Specifies whether the **Filter.FilterExpression** value is within the top *N* data values, where *N* is specified by FilterValues.FilterValue.

BottomN: Specifies whether the **Filter.FilterExpression** value is within the bottom *N* data values, where *N* is specified by **FilterValues.FilterValue**.

TopPercent: Specifies whether the **Filter.FilterExpression** value is within the top *N* percent of data values, where *N* is specified by **FilterValues.FilterValue**.

BottomPercent: Specifies whether the **Filter.FilterExpression** value is within the bottom *N* percent of data values, where *N* is specified by **FilterValues.FilterValue**.

In: Specifies whether the value of **Filter.FilterExpression** is equal to any **FilterValues.FilterValue** instances.

Copyright © 2016 Microsoft Corporation

Between: Specifies whether the value of **Filter.FilterExpression** is between the values of two **FilterValues.FilterValue** instances.

The **TopN**, **BottomN**, **TopPercent**, and **BottomPercent** operators SHOULD include ties in the resulting data. String comparisons within filters SHOULD be locale-dependent. The NULL constant is equal to itself.

The **TopPercent** and **BottomPercent** operators SHOULD round up and down, respectively, if the percentage that is specified would result in a partial item being included (for example, if the Top 25% of 13 items is four items and the Bottom 75% is nine items). If the value of the **Filter.Operator** element is "In", multi-value report parameters that have the ReportParameter.MultiValue element specified with a value of true MUST be supported and treated as multiple **FilterValue** instances.

In the following example, if "Cities" is a multi-value parameter for a Filter that references "Cities" within any **FilterValues.FilterValue** elements, the following RDL:

```
<FilterValues>
   <FilterValue>=Parameters!Cities.Value</FilterValue>
</FilterValues>
```

MUST be equivalent to the following RDL:

```
<FilterValues>
   <FilterValue>=Parameters!Cities.Value[0]</FilterValue>
   <FilterValue>=Parameters!Cities.Value[1]</FilterValue>
   […]
</FilterValues>

~~2.341.1 Expression Syntax~~

2.345.1 Expression Syntax

In addition to supporting constants as element values, RDL supports an expression language. All expressions in RDL MUST begin with the character "=" and MUST be specified in a Visual Basic–compatible syntax [~~MS~~MSFT-VBNET].

Expression values that do not begin with "=" are treated as constants of the type expected by the property if that type is Boolean ([XMLSCHEMA2] section 3.2.2), String ([XMLSCHEMA2] section 3.2.1), or Integer ([XMLSCHEMA2] section 3.3.17) [XMLSCHEMA2/2].

For example, the Visibility.Hidden property expects a **Boolean**. Therefore, the strings true and false are treated as **Boolean** constants. For properties that take a **Variant**, all values that do not start with "=" are treated as string constants.

~~2.341.2 Custom Code References~~

2.345.2 Custom Code References

A report may include references to custom code methods and custom assemblies. Custom assemblies that are referenced in a report MUST be specified at the report level via the CodeModules element. Static methods in custom assemblies MAY be accessed globally from expressions within the report, and, if referenced from expressions, MUST use the following syntax.

```
ClassName.MethodName(…)
```

The following is an example of this syntax.

```
MyCurrencyConverterClass.Convert(…)
```

A report may contain instance-based methods. Such methods MUST be instantiated though the Classes element. The methods MAY be accessed via a globally available **Code** member, and they MUST use the following syntax.

```
Code.InstanceName.MethodName(…)
```

The following is an example of this syntax.

```
Code.CurrencyConverter.Convert(…)
```

~~2.340.1~~2.345.3 ~~2.341.3~~ Built-in Code Namespace References

In addition to explicit user-defined references as specified through custom code references, expressions MAY reference function libraries if they are made available by the implementation.<~~196~~198>

~~2.341.4 Data Types~~

2.345.4 Data Types

Every expression that is used in an expression element or as an argument to an RDL function MUST return one of the following RDL data types: String ([XMLSCHEMA2] section 3.2.1), Boolean ([XMLSCHEMA2] section 3.2.2), Float ([XMLSCHEMA2] section 3.2.4), DateTime ([XMLSCHEMA2] section 3.2.7), Binary, or an array of these types (a VariantArray).<~~197~~199>

~~2.340.2~~2.345.5 ~~2.341.5~~ Expression Error Handling

Errors that occur during expression evaluation fall into one of two categories:

- Critical errors
  - Critical errors result in the report (or the currently requested page) failing to render, returning an error message instead.
  - Errors in the evaluation of the following properties are considered to be critical errors: Filter.FilterExpression, Filter.FilterValues, Group.GroupExpressions, Variable.Value, Visibility.Hidden, and SortExpression.Value.

Copyright © 2016 Microsoft Corporation

- Non-critical errors
  - A non-critical error does not cause the report to fail to render but instead registers a warning and falls back to a default value for the particular RDL property.

~~2.340.3~~2.345.6 ~~2.341.6~~ Global Collections

The following global object collections are accessible from expressions, with restrictions as specified in the following subsections for each collection.

Collection	Specification	Item type
Fields	Fields in the current dataset.	Field
Parameters	Report parameters.	Parameter
ReportItems	All text boxes in the report.	**ReportItem**
Globals	Global variables.	**Variant**
User	User-specific data.	**Variant**

Applies to RDL schema 2012/01 [MSFT-RDL201201]

Collection	Specification	Item type
Scopes	Scopes within the report.	Scope

Data sources in global collections, if referenced from expressions, MUST use standard Visual Basic collection syntax [MSFT-VBNET], specified as one of the following:

Collection!*ObjectName*

Collection.*Item*("*ObjectName*")

Collection("*ObjectName*")

such as in the following example:

```
User!Language
```

Optionally, items in the **Globals** and **User** collections MAY also be accessed by using property syntax:

```
Collection.ObjectName
```

such as in:

```
Globals.PageNumber
```

Circular references involving items in global collections are errors.

~~2.340.3.1~~2.345.6.1 ~~2.341.6.1~~ Fields

The **Fields** collection contains a set of Field objects. A **Field** object may specify one or more properties. If one of these properties is referenced in an expression, it MUST be among the set of predefined properties that can be accessed by using either the property syntax:

```
Fields!FieldName.PropertyName
```

or the collection syntax:

Fields!*FieldName*!*PropertyName*

Fields!*FieldName*("*PropertyName*")

Fields!*FieldName*.Properties("*PropertyName*")

such as:

```
Fields!Region.BackgroundColor
```

~~2.340.3.2~~2.345.6.2 ~~2.341.6.2~~ Predefined Field Properties

When a report is executed, dataset queries may return a different set of fields than were originally defined in the report. The **IsMissing** property specifies whether the field was found in the resulting dataset. The **Value** property of missing fields is NULL.

In addition, data providers that support field properties can provide additional properties, which can be accessed only by using collection syntax. If the data provider does not support the requested property or if the field is not found when the query is executed, the default value returned is NULL for **String Object** properties, 0 for Integer ([XMLSCHEMA2] section 3.3.17) properties, and false for Boolean ([XMLSCHEMA2] section 3.2.2) properties. The value of all predefined field properties is the data type specified in the following table. The value of all other properties is a **Variant**.

The following are all predefined properties of the Field object.

Property name	Type	Expected Values
Value	**Variant**	
IsMissing	**Boolean**

~~2.340.3.3~~2.345.6.3 ~~2.341.6.3~~ Fields Collection in Reports with Multiple Datasets

If a Report contains multiple datasets, there are multiple virtual Fields collections in the report. The context of the expression usage in the report MUST unambiguously specify which of these is accessed when referencing the **Fields** collection as one of the following three possible options:

- ~~•~~ Inside of an aggregate, if the *Scope* argument refers to a dataset, **Fields** refers to the fields in that dataset.
- ~~•~~ Within a data region, the **Fields** collection refers to the fields in the dataset for that region.
- ~~•~~ Outside of a data region, direct references to fields (outside an aggregate) are undefined.

~~2.340.3.4~~2.345.6.4 ~~2.341.6.4~~ Parameters

The **Parameters** collection contains a set of Parameter objects (one **Parameter** object per ReportParameter specified in the report). The **Parameter** object specifies a set of predefined properties that, if referenced from an expression, MUST be accessed by using either the property syntax or the collection syntax (see Fields).

The only properties specified for **Parameter** are **Value**, **Label**, **Count**, and **IsMultiValue** as specified in the following table:

Property name	Type	Specification
Value	**Variant** VariantArray	The **Value** property is determined by the parameter value input provided to the current report execution session. The data type of **Value** is a **Variant** for single-value parameters and **VariantArray** for multivalued parameters.
Label	String ([XMLSCHEMA2] section 3.2.1) **StringArray**	The **Label** property is determined by the value of the **Label** or **LabelField** element of the corresponding parameter value in the **ValidValues** list. The data type of **Label** is a **String** for single-value parameters and **StringArray** for multivalued parameters.
Count	Integer ([XMLSCHEMA2] section 3.3.17)	The **Count** property specifies the number of values and labels. The value of the **Count** property is 1 if it is not a multivalued parameter; it is 0 if the parameter does not have a value that is valid (or values have not yet been supplied).
IsMultiValue	Boolean ([XMLSCHEMA2] section 3.2.2)	The **IsMultiValue** property specifies whether the parameter is multivalued. The value of this property is **Boolean**.

Copyright © 2016 Microsoft Corporation

~~2.340.3.5~~2.345.6.5 ~~2.341.6.5~~ ReportItems

Only text boxes appear as **ReportItem** objects in the **ReportItems** collection.<~~198~~200>

The **ReportItem** object has a collection of predefined properties that, if referenced from expressions, MUST be referenced by using either the property syntax or the collection syntax (see the Fields object).

The only property defined for **ReportItem** is **Value**. The data type of **Value** is **Variant**.

The value of the current **ReportItem** MAY be referenced in property expressions by using **Me.Value** or simply **Value**. Aggregate functions MUST NOT include a reference to **Me.Value** or **Value**.

Expressions SHOULD NOT reference report items that are not defined at or above the current **grouping scope** (such as peer or descendent grouping scopes). If such a reference is used, the result is undefined.

The scope for expressions in page headers and page footers is considered to be items on the current page.

~~2.340.3.6~~2.345.6.6 ~~2.341.6.6~~ Globals

Members of the **Globals** collection are of type **Variant**, but individual members have the following known return types.

Property name	Type	Specification
PageNumber	Integer ([XMLSCHEMA2] section 3.3.17)	Current page number. The member MUST NOT be referenced outside of the page header or page footer of the report.
TotalPages	**Integer**	Total number of pages in the report. The member MUST NOT be referenced outside of the page header or page footer of the report.
ExecutionTime	DateTime ([XMLSCHEMA2] section 3.2.7)	The date and time at which the report began executing.
ReportServerUrl	String ([XMLSCHEMA2] section 3.2.1)	URL to the report server, such as http://reportserver/reports.
ReportFolder	**String**	Full path on the report server to the folder containing the report. For example, for the report http://reportserver/reports/salesreports/budgeting/currentbudget, the **ReportFolder** is /salesreports/budgeting.
ReportName	**String**	Name of the report in the report catalog. For example, for the report http://reportserver/reports/salesreports/budgeting/currentbudget, the **ReportName** is "currentbudget".
RenderFormat.Name	**String**	Name of the renderer.<~~199~~201>
RenderFormat.IsInteractive	Boolean ([XMLSCHEMA2] section 3.2.2)	Specifies whether the current user request is for an interactive rendering format.
RenderFormat.DeviceInfo	ReadOnlyNameValueCollection	A collection that holds the keys and values of the **deviceinfo** parameters of the current rendering request.<~~200~~202>

Copyright © 2016 Microsoft Corporation

~~2.340.3.7~~2.345.6.7 ~~2.341.6.7~~ ReadOnlyNameValueCollection

A **ReadOnlyNameValueCollection** collection is identical to the **NameValueCollection** [~~MS~~MSFT-VBNET] class of the Microsoft .NET Framework, with the following exceptions:

- The collection is read-only. Only the following class get-properties and methods exist:
  - **Properties**: **AllKeys**, **this[int index]**, **this[string name]**, **Count**, **Keys**
  - **Methods**: **CopyTo**, **Get**, **GetKey**, **GetValues**, **HasKeys**, **GetEnumerator**
- An additional class get-property called **AllValues** exists. This property gets all values in the entire read-only name value collection and returns a StringArray of those values.

~~2.340.3.8~~2.345.6.8 ~~2.341.6.8~~ User

Members of the **User** collection are of type **Variant**, but individual members have the following known return types.

Property name	Type	Specification
UserID	String ([XMLSCHEMA2] section 3.2.1)	ID of the user executing the report.
Language	**String**	Language ID of the client executing the report.

~~2.340.3.9~~2.345.6.9 ~~2.341.6.9~~ DataSources

The **DataSources** collection contains a collection of DataSource objects. Only data sources that are used in the Body of the report are included in the **DataSources** collection. Data sources that are used only in parameter valid values and default values properties are not included.

The **DataSource** object specifies the following properties.

Property name	Type	Specification
Type	String ([XMLSCHEMA2] section 3.2.1)	Type of data provider for the data source.
DataSourceReference	**String**	Path to the data source (**Nothing** for embedded data sources).

~~2.340.3.10~~2.345.6.10 ~~2.341.6.10~~ DataSets

The **DataSets** collection contains a collection of DataSet objects. Only datasets used in the Body of the report are included in the **DataSets** collection. Datasets that are used only in parameter valid values and default values properties are not included.

The **DataSet** object specifies the following properties.

Copyright © 2016 Microsoft Corporation

Property name	Type	Specification
CommandText	String ([XMLSCHEMA2] section 3.2.1)	The **CommandText** of the dataset.
RewrittenCommandText	**String**	The **CommandText** of the dataset after optionally rewritten by the report execution engine.

~~2.340.3.11~~2.345.6.11 ~~2.341.6.11~~ Variables

The **Variables** collection contains a collection of Variable objects (one object each per variable defined on report element and group elements).

The **Variable** object has a collection of predefined properties that, if referenced from expressions, MUST be accessed via either the property syntax or the collection syntax (see Fields).

The **Variable** object specifies the properties that are described in the following table.

Property name	Type	Specification
Value	Serializable	Gets the value of the report or group variable.Sets the value of the report variable, if the report variable is writable.
Writable	Boolean	Indicates whether the variable is writable through expressions.

The **Variable** object specifies the method that is described in the following table.

Method name and argument type	Return type	Specification
SetValue(Serializable)	Boolean	Sets the value of a report variable. Returns true if setting the value was successful. Returns false for group variables and for non-writable report variables.

Expressions SHOULD NOT reference variables that are not defined at or above the current grouping scope (such as peer or descendent grouping scopes).

~~2.340.3.12~~2.345.6.12 ~~2.341.6.12~~ Restrictions on Use of Global Collections

The Fields, Parameters, ReportItems, and Globals collections have restrictions on the contexts in which they can be used in expressions. The following table specifies where these global collections MAY ("Yes," or with restrictions specified below) or MUST NOT ("No") be used.

Note that, because references to items in global collections can be dynamic, such as in "=ReportItems(Parameters!Param1.Value)", all error checking occurs both during report validation (to

catch static disallowed references) and during report execution (to catch dynamic disallowed references).

Cyclic expressions (such as TextBox1=TextBox2+1; TextBox2=TextBox1+1) are treated as non-critical errors.

~~2.340.3.13~~2.345.6.13 ~~2.341.6.13~~ Scopes

Applies to RDL schema 2012/01 [MSFT-RDL201201]

The **Scopes** collection contains a collection of **Scope** objects. The **Scopes** collection is indexed by scope name and is bound to the DataSet in the report that has a DefaultRelationship to the current scope or to one of its ancestor scopes.

The **Scope** object specifies the following property.

Property name	Type	Specification
Fields	Fields	The **Fields** from the **DataSet** to which the scope is bound.

The **Scope** object has a **Fields** property, which contains the **Fields** from the **DataSet** to which the scope is bound.

The **Scopes** collection MAY only be used in expressions that have the following form.

```
Scopes!ScopeName.Fields!FieldName.Value
```

~~2.340.4~~2.345.7 ~~2.341.7~~ Aggregate Functions

RDL specifies the following standard aggregate functions:

- **Sum**
- **Avg**
- **Max**
- **Min**
- **Count**
- **CountDistinct**
- **CountRows**
- **StDev**
- **StDevP**
- **Var**
- **VarP**

In addition, RDL specifies the following advanced aggregate functions:

- **First**
- **Last**

Copyright © 2016 Microsoft Corporation

- **Previous**
- **RunningValue**
- **RowNumber**
- **Aggregate**

Common parameters used by aggregate functions are specified in the following Scope and Recursive sections. A detailed specification for each aggregate function follows in subsequent sections.

~~2.341.7.1 Scope~~

2.345.7.1 Scope

There are three types of explicit scopes for expressions. These types are as follows:

- DataSet scope.
- **DataRegion** scope.
- Grouping scope.

Explicit scopes (**DataSets**, **DataRegions**, and **Groups**) MUST have unique names.

In addition, there are three types of implicit scopes that do not have names:

- Top-level Report scope.
- Page scope.
- Cell scope (the intersection of the innermost row scope and innermost column scope).

Scopes represent a hierarchy. At any level in that hierarchy, there can be only one ancestor (except for the top-level report scope and the page scope) but an unlimited number of descendants as well as peer scopes. The "innermost scope" is specified as the position within that scope hierarchy relative to the current RDL expression.

The *Scope* parameter of an aggregate function MUST be a constant.

Three different report areas are distinguished for the *Scope* parameter.

For expressions inside data regions:

- Within a data region, the *Scope* argument MAY be omitted for all aggregates with the exception of RunningValue and RowNumber.
- If omitted, the scope is determined as the innermost scope containing the report item in which the aggregate is used.

For expressions outside of data regions (in the report Body):

- When used outside of a data region, the scope, if specified, MUST refer to a dataset name.
- If more than one dataset exists in the report, the *Scope* argument MUST be specified.
- If exactly one dataset exists in the report, the *Scope* argument MAY be omitted.

For expressions in page headers and page footers:

Copyright © 2016 Microsoft Corporation

- ~~If the *Scope* argument is omitted in page headers and page footers, the scope is the data on the current page. In this case, report items MAY be used in an aggregate expression, but references to fields MUST NOT appear in the aggregate expression.~~
- ~~If a scope is specified, fields MAY be used, but report items MUST NOT be used.~~

~~2.341.7.2 Recursive~~

2.345.7.2 Recursive

Specifying an aggregate as recursive indicates that the aggregate applies to all data in the current instance of the given scope and all descendant instances of the current instance.

Recursive MAY be specified on standard aggregate functions: **Sum**, **Avg**, **Max**, **Min**, **Count**, **CountDistinct**, **CountRows**, **StDev**, **StDevP**, **Var**, or **VarP**.

Recursive SHOULD NOT be specified if the scope has no **Parent** property value specified on the group expression; if it is specified, it will be ignored.

Recursive MUST NOT be specified if the aggregate function is nested inside another aggregate function.

Recursive MUST NOT be specified if the aggregate function contains other aggregate functions.

The following table is an example of data aggregations, calculated without taking into account the recursive hierarchy ("Sales" column), and calculated with the recursive grouping based on ManagerID ("AllSales" column).

EmployeeID	ManagerID	Sales (Non Recursive)	AllSales (Recursive with Parent = ManagerID)
1	NULL	10	70
1a	1	10	30
1a1	1a	10	10
1a2	1a	10	10
1b	1	10	30
1b1	1b	10	10
1b2	1b	10	10

~~2.341.7.3 Recursive Depth~~

2.345.7.3 Recursive Depth

In recursive hierarchies, the **Level** function can be used to determine the current depth of the recursive hierarchy.

Aggregate functions in the page header or page footer with an omitted *Scope* parameter MUST NOT contain any aggregate functions. Aggregate functions with the name of a dataset as its *Scope* parameter MUST NOT contain any aggregate functions.

	Recursive	**Enum**	Recursive | Simple (Default). Specifies whether the aggregate should be calculated recursively. Optional. See also Recursive.

* Decimal and double refer to CLR data types in this context.

** Directly referenced aggregate functions are contained within the *Expression* argument but are not contained within a nested aggregate or the *Destination* or *Result* arguments to a **Lookup** function.

	Expression	SqlGeography or SqlGeometry	See the Sum function. All the expressions MUST be either of type SqlGeography or SqlGeometry.
	Scope	String	See the **Sum** function.

~~2.340.4.13~~2.345.7.17 ~~2.341.7.17~~ Aggregate Function: First

The following are the arguments, types, and specification of the **First** aggregate function.

Function	Arguments	Type	Specification
First	*Return*	**Variant** or **Binary**	Returns the first value of the expression within the scope (after all sorting up through the *Scope* has been applied). *Return* type is the same as the expression type.
	Expression	**Variant** or **Binary**	See the Sum function.
	Scope	String	See the **Sum** function.

~~2.340.4.14~~2.345.7.18 ~~2.341.7.18~~ Aggregate Function: Last

Function	Arguments	Type	Specification
Last	*Return*	**Variant** or **Binary**	Returns the last value of the expression within the scope (after all sorting up through the *Scope* has been applied). *Return* type is the same as the expression type.
	Expression	**Variant** or **Binary**	See the Sum function.

Function	Arguments	Type	Specification
			the aggregate function. Returns NULL if there is no corresponding previous instance.
	Expression	**Variant** or **Binary**	The expression for which to retrieve the previous value. If the expression contains an aggregate, **Previous** aggregates the data within the previous instance of the *PreviousScope* that corresponds to the current instance of the ~~aggregate's~~aggregate's *Scope*. An aggregate *Scope* equal to the *PreviousScope* indicates that all of the data in the *PreviousScope* is aggregated. The scope of the aggregate MUST be contained by (or equal to) *PreviousScope*. The aggregate function MUST NOT be **Aggregate** or **Previous**. The aggregate MUST NOT be recursive. The functions Level and InScope MUST NOT be used in the expression.
	PreviousScope	String	If specified, MUST be the name of a group or data region that contains (directly or indirectly) the report item that the aggregate function is used in. **Previous** retrieves the data in the previous instance of the group or data region. A *PreviousScope* of **Nothing** specifies that **Previous** retrieves the value of the expression for the previous detail row of data. *PreviousScope* MUST be a constant, not an expression. Optional. Default: The current scope (**Nothing** if in a detail scope).

~~2.340.4.16~~2.345.7.20 ~~2.341.7.20~~ Aggregate Function: RunningValue

The following are the arguments, types, and specification of the **RunningValue** aggregate function.

Function	Argument	Type	Specification
RunningValue	*Return*	See the *Function* argument.*	A running aggregate of the expression, using the specified aggregate function.
	Expression	See *Function*	The expression to aggregate. MUST NOT contain the **First**, **Last**, **Previous**, or **RunningValue** functions. MAY reference other aggregate functions if their *Scope* is the same as, or a child scope of, this function's *Scope*. For all distinct scopes directly** referenced in the expression, there MUST be one scope that has all other scopes as its ancestor.
	Function	**Enum**	Name of an aggregate function for which to calculate a running value (MUST NOT be **CountRows**, **RunningValue**, **RowNumber**, or **Aggregate**). *Expression* type and *Return* type are determined by the aggregate function used.
	Scope	String	If specified, MUST be "Nothing", or the name of a group or data region that contains (directly or indirectly) the report item that the aggregate function is used in. The scope specifies that the running value is either reset whenever the group expression changes or reset with each new instance of the data region. A value of "Nothing" specifies that the running value never resets. The *Scope* argument MUST be a constant, not an expression.

Copyright © 2016 Microsoft Corporation

* The *Return* data type is determined by the function that is used in the ~~*Function* **Enum**~~*Function***Enum** argument of the **RunningValue** call. For example, if **Sum** is used as ~~*Function* **Enum**~~*Function***Enum** value for **RunningValue**, the return type follows the rules for the **Sum** function.

** Directly referenced aggregate functions are contained within the *Expression* argument but are not contained within a nested aggregate or the *Destination* or *Result* arguments to a **Lookup** function.

~~2.340.4.17~~2.345.7.21 ~~2.341.7.21~~ Aggregate Function: RowNumber

The following are the arguments, types, and specification of the **RowNumber** aggregate function.

Function	Arguments	Type	Specification
RowNumber	*Return*	Integer	The row number of the current row or group instance.
	Scope	String	See RunningValue.

~~2.340.4.18~~2.345.7.22 ~~2.341.7.22~~ Aggregate Function: Aggregate

The following are the arguments, types, and specification of the **Aggregate** aggregate function.

Function	Arguments	Type	Specification
Aggregate	*Return*	Determined by data provider.	Calculates a custom (data provider-defined) aggregate for the expression at the given scope. If the data provider does not support this function or if the data is not available for the given expression or scope, NULL is returned.
	Expression	**Variant**	The expression to aggregate. MUST be a simple field reference, for example: =Aggregate(Fields!Sales.Value,Year)
	Scope	String	See the Sum function. All group expressions for the *Scope* specified (and all containing group scopes) MUST be simple field references or (non-expression) constants.

~~2.340.4.21~~2.345.7.25 ~~2.341.7.25~~ Filtering and Aggregates

The behavior of filters and aggregate functions is specified as follows:

- ~~-~~Aggregates that use dataset scopes are applied after the dataset filter (if any) is applied to the data.
- ~~-~~Aggregates that use data region scopes are applied after the data region filter (if any) is applied to the data.
- ~~-~~Group filters are ignored for the purposes of calculating aggregates.
- ~~-~~The **Aggregate** aggregate function MUST NOT appear in a report that contains any Filter elements.
- ~~-~~**First**, **Last**, **Previous**, **RunningValue**, and **RowNumber** are applied after containing data region and group filters are applied.
- ~~-~~Aggregates that contain other aggregate functions are applied after containing data region and group filters are applied for all scopes referenced in the expression.

~~2.340.4.22~~2.345.7.26 ~~2.341.7.26~~ Additional Functions

This section describes additional functions that can be referenced from expressions.

~~2.341.7.26.1 Dynamic Scoping~~

2.345.7.26.1 Dynamic Scoping

Report items contained within a cell of a Tablix that has automatic subtotals (as a result of a drilldown) have dynamic scoping.

For example, consider a tablix that has a Year column group and a Product row group. If the value of the text box in the detail cell is =Sum(Fields!Sales.Value), each detail cell will be grouped on both year and product. However, the year subtotal (shown when the Year group is hidden) will be grouped only on product and the product subtotal will be grouped only on year (and the grand total will not be grouped on either).

The InScope function can be used to determine what the current instance is grouped on.

~~2.340.4.22.1~~2.345.7.26.2 ~~2.341.7.26.2~~ Function: InScope

Function	Arguments	Type	Specification
InScope	*Return*	Boolean	Returns true if the current instance is within the specified scope. Otherwise,

Copyright © 2016 Microsoft Corporation

Function	Arguments	Type	Specification
			returns false.
	Scope	String	Name of a dataset, group, or data region.

A typical use for the **InScope** function is to construct links to drillthrough reports that will work in both tablix detail cells and automatic subtotal cells, as in the following example.

```
<Drillthrough>
<ReportName>=iif(InScope("Month"),"Transactions","ProductTotByYear")</ReportName>
<Parameters>
<Parameter Name=Year>
<Value>=Fields!Year</Value>
<Omit>=Not(InScope("Year"))</Omit>
</Parameter>
<Parameter Name=Month>
<Value>=Fields!Month</Value>
<Omit>=Not(InScope("Month"))</Omit>
</Parameter>
<Parameter Name=Product>
<Value>=Fields!Product</Value>
<Omit>=Not(InScope("Product"))</Omit>
</Parameter>
</Parameters>
</Drillthrough>
```

~~2.340.4.22.2~~2.345.7.26.3 ~~2.341.7.26.3~~ Semantic Query Drillthrough

For report with semantic queries that use automatic drillthrough query rewriting, the function CreateDrillthroughContext is available to generate a default drillthrough context.

~~2.340.4.22.3~~2.345.7.26.4 ~~2.341.7.26.4~~ Function: CreateDrillthroughContext

Function	Arguments	Type	Specification
CreateDrillthroughContext	*Return*	String	Returns a **DrillthroughContext** parameter value that specifies the current drillthrough context, including semantic query fields from the current scope referenced in the **Value** property of the current object (text box, image, or chart data point) and semantic query field values for the current group scopes.

This function call MUST NOT appear outside a drillthrough parameter value expression. Otherwise, the result is undefined.

~~2.340.4.22.4~~2.345.7.26.5 ~~2.341.7.26.5~~ Function: Lookup

Applies to RDL schema ~~version~~versions 2010/01 [MSFT-RDL201001] ***and 2016/01*** [MSFT-RDL201601]

Lookup functions (**Lookup**, **LookupSet**, and **MultiLookup**) provide the ability to take a value from the current scope and find a corresponding value or collection of values within a specified dataset. This is typically used in reports for converting codes into human-readable labels.

Function	Arguments	Type	Description
Lookup	*Return*	**Variant**	**Lookup** evaluates the *Source* expression for the current instance of the current scope. It then finds the first row of data in the specified *Dataset** for which the

			source value equals the *Destination* expression evaluated for that row.** It returns the value of the *Result* expression evaluated for that row, or NULL if no matching row is found. The *Return* data type is the same as the *Result* data type.
	Source	**Variant**	Specifies the value to look up. The *Source* expression result MUST match the data type of the *Destination* expression. The expression MUST NOT reference lookup functions.***
	Destination	**Variant**	Specifies the value to compare the *Source* expression to. The *Destination* expression MUST NOT reference aggregate functions, report items, or lookup functions.
	Result	**Variant**	The *Result* expression MUST NOT reference aggregate functions, report items, or lookup functions.
	Dataset	String	Name of the dataset in which to evaluate the *Destination* expression and *Result* expression. MUST be a constant, not an expression.

* After *Dataset* filters have been applied.

** The comparison SHOULD use collation settings from the *Dataset*.

*** "Lookup functions" refers to all types of lookup functions (such as **Lookup**, **LookupSet**, and **MultiLookup**).

~~2.340.4.22.5~~2.345.7.26.6 ~~2.341.7.26.6~~ Function: LookupSet

Applies to RDL schema ~~version~~versions 2010/01 [MSFT-RDL201001] ***and 2016/01*** [MSFT-RDL201601]

The main difference between Lookup and **LookupSet** is that the latter returns all matching values instead of only the first match.

Function	Arguments	Type	Description
LookupSet	*Return*	VariantArray	**LookupSet** evaluates the *Source* expression for the current instance of the current scope. It then finds all rows of data in the specified dataset for which the source value equals the *Destination* expression evaluated for that row. It returns an array containing a list of all values of the *Result* expression evaluated for each matching row, or an empty array if no matching rows are found. The list retains the order of the rows in the original dataset. Elements of the *Return* array MUST be the same data type as the *Result* data type.
	Source	**Variant**	Specifies the value to look up. The value of the expression result MUST match the data type of the *Destination* expression. The expression MUST NOT reference lookup functions.
	Destination	**Variant**	Specifies the value to compare the *Source* expression to. The *Destination* expression MUST NOT reference aggregate functions, report item, or lookup functions.

Copyright © 2016 Microsoft Corporation

Function	Arguments	Type	Description
	Result	**Variant**	The *Result* expression MUST NOT reference aggregate functions, report items, or lookup functions.
	DataSet	String ([XMLSCHEMA2] section 3.2.1)	Name of the dataset in which to evaluate the *Destination* expression and *Result* expression. MUST be a constant, not an expression.

~~2.340.4.22.6~~2.345.7.26.7 ~~2.341.7.26.7~~ Function: MultiLookup

Applies to RDL schema ~~version~~versions 2010/01 [MSFT-RDL201001] ***and 2016/01*** [MSFT-RDL201601]

The following are the arguments and types of the **MultiLookup** function.

Function	Arguments	Type	Description
MultiLookup	*Return*	VariantArray	**MultiLookup** evaluates the *Source* expression for the current instance of the current scope. Then, for each item in the *Source* array, it finds the first row of data in the specified dataset for which the item in the *Source* array equals the *Destination* expression evaluated for that row.<~~202~~204> It returns a **Variant** array containing a list of values of the *Result* expression evaluated for each such first matching row. **MultiLookup** returns an empty array if no matching rows are found for any item. The items in the array retain the order of the items in the *Source* array. Elements of the *Return* array MUST be the same data type as the *Result* type.
	Source	**VariantArray**<~~203~~205>	The value to look up. Items in the array MUST match the data type of the *Destination* expression. The expression MUST NOT reference lookup functions.*
	Destination	**Variant**	Specifies the value to compare the *Source* expression to. The *Destination* expression MUST NOT reference aggregate functions, report items, or lookup functions.*
	Result	**Variant**	The expression MUST NOT reference aggregate functions, report items, or lookup functions.*
	Dataset	**String**	Name of the dataset in which to evaluate the *Destination* expression and *Result* expression. MUST be a constant, not an expression.

* "Lookup functions" refers to all types of lookup functions (such as Lookup, LookupSet, and **MultiLookup**).

The following are the arguments and types of the **MinValue** function.

Function	Arguments	Type	Description
MinValue	*Return*	Variant	**MinValue** accepts a variable number of arguments and returns the smallest argument value. **MinValue** MUST NOT accept less than two arguments. If any argument contains an evaluation error, **MinValue** produces an evaluation error. The data type of the *Return* value MUST be the same as the data type of the smallest argument value.
	Arg1	**Variant**	The first value to compare.
	Arg2	**Variant**	The second value to compare.
	ArgN	**Variant**	The Nth value to compare.

~~2.340.4.22.8~~2.345.7.26.9 ~~2.341.7.26.9~~ Function: MaxValue

Applies to RDL schema 2011/01 [MSFT-RDL201101]

The following are the arguments and types of the **MaxValue** function.

Function	Arguments	Type	Description
MaxValue	*Return*	Variant	**MaxValue** accepts a variable number of arguments and returns the largest argument value. **MaxValue** MUST NOT accept less than two arguments. 	Arg2	**Variant**	The second value to compare.
	ArgN	**Variant**	The Nth value to compare.

3 ~~3~~ Structure Examples

The following sections provide examples for the structures defined in the RDL file format specification. Examples of the RDL file format include examples that demonstrate defining the major components of a report; these include defining the report, the data, and various report items.

3.1 ~~3.1~~ Report in RDL schema 2008/01

The following is an example of the RDL for a report in RDL schema 2008/01 [MSFT-RDL200801]. It shows the usage of the various properties of a Report. The example uses elements for describing the data: DataSources and DataSets; elements for describing the structure and layout: Page, including Page.PageHeader and Page.PageFooter, and Body; and elements for describing the ReportParameters and Variables for the report.

The following figure shows an example rendering of this report.

3.2 ~~3.2~~ Report in RDL schema 2010/01

The following is an example of the RDL for a report in RDL schema 2010/01 [MSFT-RDL201001]. It shows the usage of the various properties of a Report element. The example uses elements for describing the data: DataSources and DataSets; elements for describing the structure and layout for two ReportSection elements: Page, including Page.PageHeader and Page.PageFooter, and Body; and elements for describing the ReportParameters and Variables for the report.

The following figure shows an example rendering of this report.

3.3 ~~3.3~~ Report in RDL schema 2005/01

The following is an example of the RDL for a report in RDL schema 2005/01 [MSFT-RDL200501]. It shows the usage of the various properties of a Report. This example shows elements for describing the data: DataSources and DataSets; elements for describing the structure and layout: Report.PageHeader, Report.PageFooter, and Body; and elements for describing the ReportParameters for the report.

The following figure shows an example rendering of this report.

3.4 ~~3.4~~ Column and Line Chart Examples

Applies to RDL schemas 2008/01 [MSFT-RDL200801]~~ and~~, ***2010/01*** [MSFT-RDL201001]***, and 2016/01*** [MSFT-RDL201601]

The following example report shows two independent charts. The first Chart—referenced as Chart1—starts from line 90 to line 379 in the RDL example at the end of this topic.

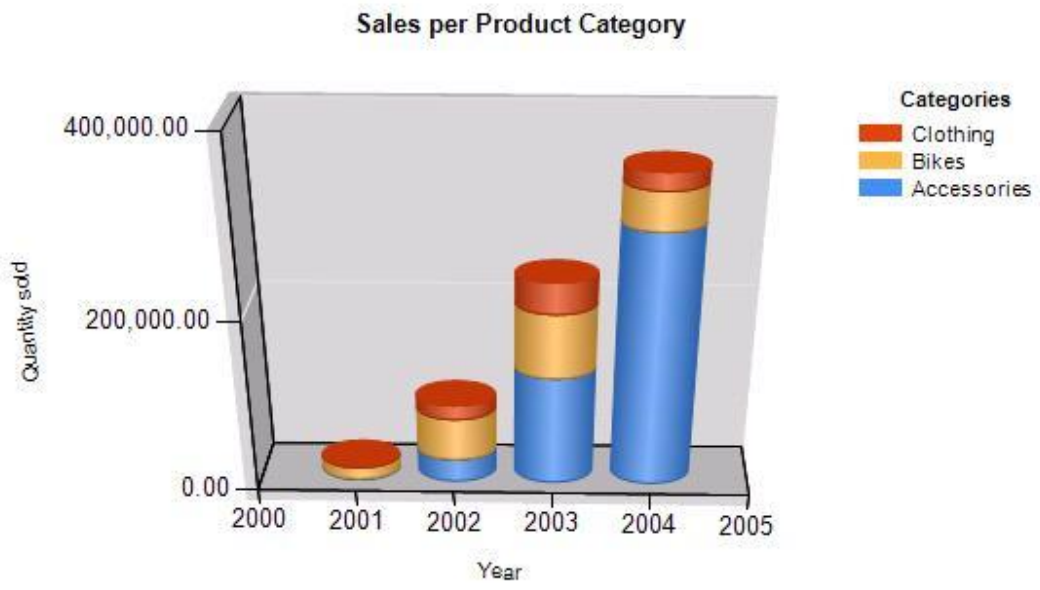

Figure 12: Chart1 example

This is a column chart with one set of series and series grouping. To understand how this chart is bound to data, consider the following table that shows the data that this chart displays.

Product category name	Year	Quantity
Accessories	2001	1003
	2002	27207
	2003	23734
	2003	103978
	2004	292660
Bikes	2001	14256
	2002	49810
	2003	30773
	2003	43241
	2004	42456
Clothing	2001	2132
	2002	16927
	2003	16515
	2003	18862
	2004	19234
Components	2001	75892

Copyright © 2016 Microsoft Corporation

Product category name	Year	Quantity
	2002	332885
	2003	266860
	2003	314930
	2004	661065

The Query and the data fields are specified from line 10 to line 44. **Chart** is bound to the DataSet "SalesPerProduct" (see line 366).

The category axis displays the value of the Year column, the value axis displays the value of the Quantity column, and the data values are grouped by the Product category name column.

The category hierarchy is specified from line 91 to line 102; the series hierarchy is specified from line 103 to line 123.

Note that the last product category in the table is not displayed in the chart. There is a filter applied to the series grouping (lines 110 to 118) to skip every row of the dataset where the product category name equals to "Components".

This chart has only one set of series specified (its name is "Quantity") in the ChartSeriesCollection element (lines 125 to 167).

Because this is a 3D chart with the projection mode set to "Perspective", 3D properties are specified from line 308 to line 313, except for the shape of the columns, which is specified by custom properties for the series (from lines 154 to 159).

The second chart (specified as Chart2 from line 380 to line 898) displays three series (one of them is calculated) with nested category grouping. This example also shows how to use secondary axes and how to align chart areas to match gridlines.

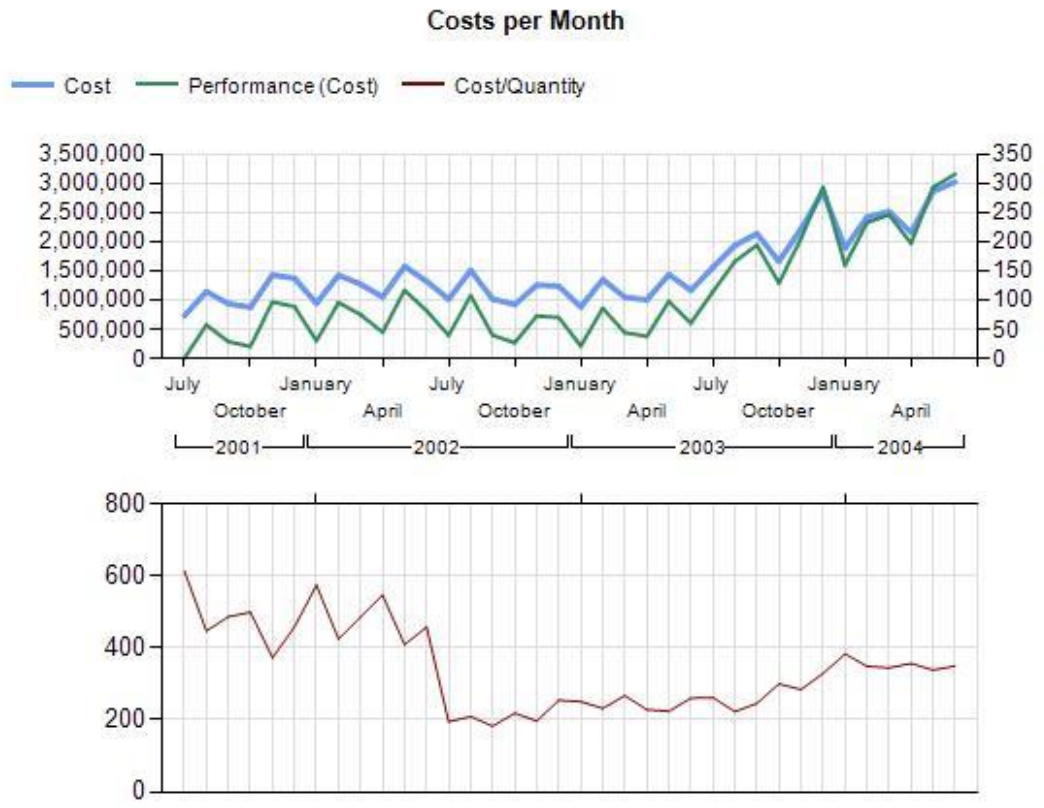

Figure 13: Chart2 example

Chart2 has two chart areas:

- Chart area "Default" (lines 533 to 676) displays series (*Cost*) and calculated series (*Performance (Cost)*).
- "ChartArea2" (lines 677 to 835) displays the Cost/Quantity series; it is aligned to chart area one on the inner plot position (line 830 to line 834).

Note that on the first chart area, the category axis displays a hierarchy of years and months. To understand this behavior, consider the following table that shows a subset of data applied to the chart. (The query and the data fields are specified from line 45 to line 87. The **Chart** is bound to the **DataSet** "CostsPerMonth".)

Year	Month	Cost	Quantity
2001	7	726727.4476	1187
	8	1142665.9223	2560
	9	934633.6329	1924
	10	873968.9087	1754
	11	1427743.5228	3837
	12	1369873.0300	2994

Copyright © 2016 Microsoft Corporation

Year	Month	Cost	Quantity
2002	1	945210.0341	1649
	2	1421680.2332	3355
	3	1270261.5659	2620
	4	1051384.7585	1927
	5	1573531.6562	3854
	6	1318811.3400	2884
	7	1013621.4783	5226
	8	1506516.6655	7227
	9	1014436.2328	5582
	10	920017.4347	4223
	11	1253971.9866	6396
	12	1235027.0052	4867

This table has two columns that are used for category grouping. Look at the embedded category members from line 381 to line 402. Also notice that—although this chart has no series grouping—two static members are specified in the series hierarchy (lines 403 to 412).

The hierarchy of category groups is automatically reflected on the category axis: Year is the parent group, and Month is the child group; therefore, **Axis** does not need any alteration.

As previously mentioned, the first chart area displays two series. The second set of series is calculated, which means that it takes the values of the first series and, depending on the formula that is applied, displays its values as a different series.

The calculated series (Series1) is specified from line 492 to line 530. Note that calculated series need references to the series they're applied to (line 527). Because the values of the calculated series are in a different range, the secondary axis is used. To achieve this, it is sufficient to assign the series to the secondary value axis (line 520) as long as the Visible property of the related axis is set to "Auto" (because "Auto" is the default value for the **Visible** element, it is not present in the RDL file).

The second area shows two category axes. Because this chart area is aligned to the previous one and the chart displays values in the same range, it is not necessary to show anything on any of the axes. Instead, the primary axis of the first chart area is reused.

The primary axis is enabled to display a frame at the bottom of the chart area, but it does not display labels (see line 715).

The secondary axis, however, is visible (line 718), and the ChartMajorTickMarks elements' Interval and IntervalOffset properties are used to display tick marks for the first month for each year (from lines 744 to 748).

The following sample report shows a doughnut chart.

Product category name	Year	Quantity
	2003	314930
	2004	661065

This chart shows the sum of the quantity for each product category regardless of the year. The following RDL snippet shows how the chart is specified to display data the way it looks in the preceding picture.

```
<Chart Name="chart1">
  <DataSetName>SalesPerProduct</DataSetName>
  <PointWidth>0</PointWidth>
  <Palette>Pastel</Palette>
  <Subtype>Plain</Subtype>
  <Type>Doughnut</Type>
  <Top>0.125in</Top>
  <Left>0.125in</Left>
  <Width>6.25in</Width>
  <Height>3.125in</Height>
  <CategoryAxis />
  <ValueAxis />
```

This is a doughnut chart bound to a DataSet that is called "SalesPerProduct" with a Pastel palette.

```
  <SeriesGroupings>
    <SeriesGrouping>
      <DynamicSeries>
        <Grouping Name="chart1_SeriesGroup1">
          <GroupExpressions>
              GroupExpression>=Fields!ProductCategoryName.Value</GroupExpression>
          </GroupExpressions>
        </Grouping>
        <Label>=Fields!ProductCategoryName.Value</Label>
      </DynamicSeries>
    </SeriesGrouping>
  </SeriesGroupings>
```

The series grouping specifies that each Product Category value is in the legend. Note that the Label element specifies the text of the item in the legend. The number of the series groups is the number of slices in the chart. The sizes of the slices are determined by the following value.

```
  <ChartData>
    <ChartSeries>
      <DataPoints>
        <DataPoint>
          <DataValues>
            <DataValue>
              <Value>=Sum(Fields!Quantity.Value)</Value>
            </DataValue>
          </DataValues>
          <DataLabel>
            <Style />
            <Value>=Fields!Quantity.Value</Value>
            <Position>BottomRight</Position>
            <Visible>true</Visible>
          </DataLabel>
        </DataPoint>
      </DataPoints>
    </ChartSeries>
  </ChartData>
```

Copyright © 2016 Microsoft Corporation

As shown in the figure, each slice has its value displayed as a DataLabel element as specified in the above RDL.

```
<Legend>
  <Visible>true</Visible>
  <Style>
    <BorderStyle>
      <Default>Solid</Default>
    </BorderStyle>
  </Style>
  <InsidePlotArea>true</InsidePlotArea>
</Legend>
```

The Legend element is displayed inside the PlotArea element with the gradient background color specified by the **PlotArea** element in the following RDL.

```
<PlotArea>
  <Style>
    <BackgroundColor>LightGrey</BackgroundColor>
    <BackgroundGradientType>TopBottom</BackgroundGradientType>
    <BorderStyle>
      <Default>Solid</Default>
    </BorderStyle>
  </Style>
</PlotArea>
```

Because this is a 3D chart, the ThreeDProperties element must be specified as well in the following RDL.

```
<ThreeDProperties>
  <Enabled>true</Enabled>
  <Rotation>30</Rotation>
  <Inclination>30</Inclination>
  <Shading>Real</Shading>
  <WallThickness>50</WallThickness>
</ThreeDProperties>
```

The following RDL specifies the chart title text and the chart style.

```
<Style>
  <BackgroundColor>White</BackgroundColor>
</Style>
<Title>
  <Caption>Sales per Product Category</Caption>
</Title>
</Chart>
```

3.6 ~~3.6~~ CustomReportItem Example

The following is an example RDL definition of a CustomReportItem for the RDL schema 2008/01 [MSFT-RDL200801] version of the element, with its data. The example is based on the Microsoft Polygons example available at [MSDN-RDLDT]. The rendered snippet is pictured in the following figure.

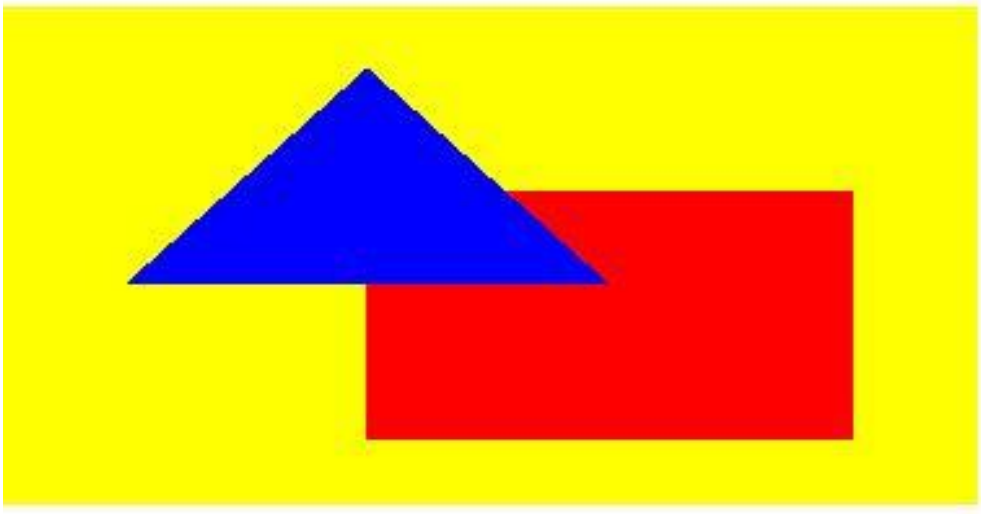

Figure 15: A data source is defined as embedded XML.

```
<DataSources>
  <DataSource Name="PolygonsData">
    <ConnectionProperties>
      <DataProvider>XML</DataProvider>
      <ConnectString />
    </ConnectionProperties>
  </DataSource>
</DataSources>
```

A single DataSet element is defined with five Fields elements, named in both the Query and the Report as "Object", "Color", "Point", "X", and "Y".

```
<DataSets>
  <DataSet Name="DataSet1">
    <Fields>
      <Field Name="Object">
        <DataField>Object</DataField>
      </Field>
      <Field Name="Color">
        <DataField>Color</DataField>
      </Field>
      <Field Name="Point">
        <DataField>Point</DataField>
      </Field>
      <Field Name="X">
        <DataField>X</DataField>
      </Field>
      <Field Name="Y">
        <DataField>Y</DataField>
      </Field>
    </Fields>
    <Query>
      <DataSourceName>PolygonsData</DataSourceName>
```

The Query.CommandText element contains the XML. Note that the XML brackets ("<" and ">") have had to be replaced with encoded versions ("<" and ">") to avoid confusing an RDL reader. The following table illustrates the data.

The **CustomReportItem** element has its CustomReportItem.Name attribute set to "customReportItem1". It is set to 0.125 inches from the top of its containing object (either the Body or a report item) and, because no CustomReportItem.Left element is defined, the position of its left is the position of the left of its containing object. The custom report item will be 2 inches high and 10 centimeters wide.

```
<CustomReportItem Name="customReportItem1">
```

Copyright © 2016 Microsoft Corporation

```
<Top>0.125in</Top>
<Height>2in</Height>
<Width>10cm</Width>
```

The CustomReportItem.Type of the element is set to a name recognizable by the rendering engine, so that custom code to render this item can be utilized. The CustomData.DataSetName element points to the prepared data.

```
<Type>Polygons</Type>
<CustomData>
  <DataSetName>DataSet1</DataSetName>
```

A CustomData.DataColumnHierarchy element must be defined, although this example only has one column hierarchy, which covers all rows.

```
  <DataColumnHierarchy>
    <DataMembers>
      <DataMember />
    </DataMembers>
  </DataColumnHierarchy>
```

The DataRowHierarchy element is also mandatory and in this case uses a two-level hierarchy to separate the two objects, so that the lower hierarchy is processed for each object in turn.

```
  <DataRowHierarchy>
    <DataMembers>
```

The outer DataMember element is specified with a Group that is named "Object", which groups on the value of the Object field. The **DataMember** has two CustomProperty elements defined. The name of these custom properties is only relevant to the custom code, which must look for and match "poly:Color" and "poly:Hyperlink". The value of the first custom property is set to the value of the Color field from the data set; the value of the second custom property is set to a URL that is intended to be set as the Action of an Image that the custom code will create.

```
      <DataMember>
        <Group Name="Object">
          <GroupExpressions>
            <GroupExpression>=Fields!Object.Value</GroupExpression>
          </GroupExpressions>
        </Group>
        <CustomProperties>
          <CustomProperty>
            <Name>poly:Color</Name>
            <Value>=Fields!Color.Value</Value>
          </CustomProperty>
          <CustomProperty>
            <Name>poly:Hyperlink</Name>
            <Value>http://microsoft.com</Value>
          </CustomProperty>
        </CustomProperties>
```

Within the outer DataMember element, an inner DataMembers collection is specified. A single **DataMember** descendant is specified.

```
        <DataMembers>
```

Copyright © 2016 Microsoft Corporation

```
            <DataMember>
```

A Group element is specified so that a sort can be defined. Since the data is known to be good, no grouping expression is specified. The data is sorted on the value of the Point field.

```
              <Group Name="Point" />
              <SortExpressions>
                <SortExpression>
                  <Value>=Fields!Point.Value</Value>
                </SortExpression>
              </SortExpressions>
            </DataMember>
          </DataMembers>
        </DataMember>
      </DataMembers>
    </DataRowHierarchy>
```

There is only one leaf **DataMember** in the **DataRowHierarchy**, so there is only one DataRow element specified. The row has two cells in it, specifying X and Y data based on the value of the X and Y fields.

```
    <DataRows>
      <DataRow>
        <DataCell>
          <DataValue>
            <Name>X</Name>
            <Value>=Fields!X.Value</Value>
          </DataValue>
          <DataValue>

          </DataValue>
        </DataCell>
      </DataRow>
    </DataRows>
  </CustomData>
```

Further values are specified for the custom code by using a CustomProperties element to define four name/value pairs. Again, the value of the Name element must be matched in code and has no relevance to any namespace. The value of each Value element could be expressed as a literal or as an expression.

```
  <CustomProperties>
    <CustomProperty>
      <Name>poly:MaxX</Name>
      <Value>200</Value>
    </CustomProperty>
    <CustomProperty>
      <Name>poly:MinX</Name>
      <Value>0</Value>
    </CustomProperty>
    <CustomProperty>
      <Name>poly:MaxY</Name>
      <Value>200</Value>
    </CustomProperty>
    <CustomProperty>
      <Name>poly:MinY</Name>
      <Value>0</Value>
    </CustomProperty>
  </CustomProperties>
```

A Style element specifies a background color that the custom code may use. It also specifies a default foreground color for the custom code to use. The empty Border element has no effect.

```
    <Style>
      <Border />
      <BackgroundColor>Yellow</BackgroundColor>
      <Color>Red</Color>
    </Style>

  </CustomReportItem>
```

3.7 ~~3.7~~ Tablix Example 1

The following is an example RDL definition of a Tablix element that is used in a very simple manner. The tablix acts as a container for a Rectangle; the rectangle contains the report layout. This layout provides similar functionality to the List element in versions of RDL prior to 2008/01 [MSFT-RDL200801]. The data is fetched from the Microsoft Adventure Works example database. An extract of the rendered XML is as follows.

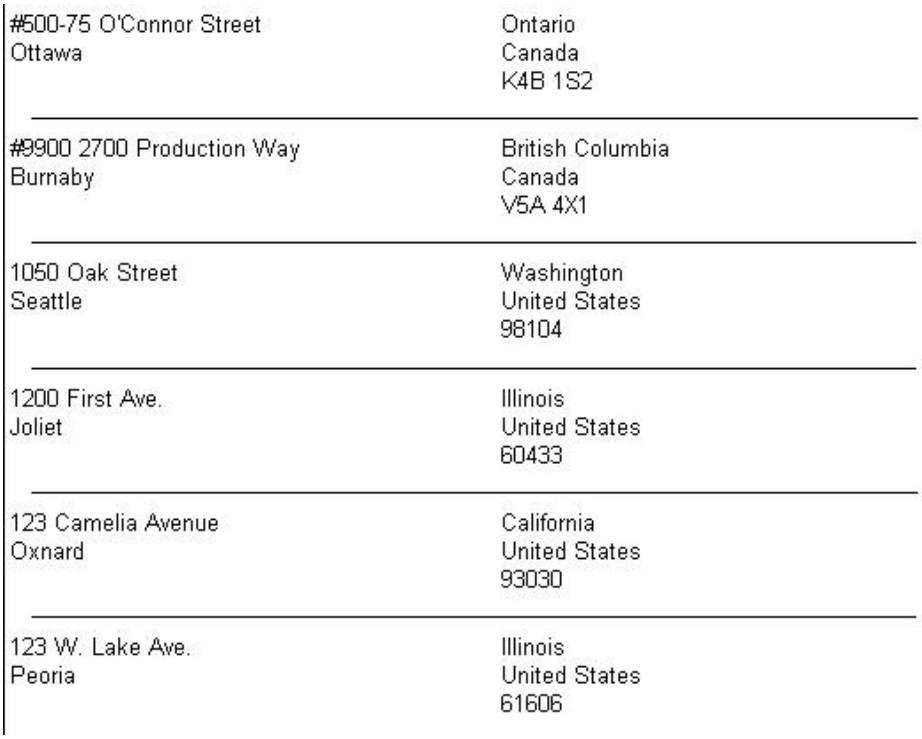

Figure 17: Tablix example 1

The **Tablix** element has its Tablix.Name attribute set to "Tablix1". It has a single uncomplicated column, needing only the minimal TablixColumnHierarchy. The TablixRowHierarchy is almost as simple, but because the single tablix row is to be repeated for each row of data, the TablixMember is defined with a Group. There is no grouping, filtering, or sorting to be done on the **Group**, which defines it as a detail group.

```
    <Tablix Name="Tablix1">
      <TablixColumnHierarchy>
        <TablixMembers>
```

```
      <TablixMember />
    </TablixMembers>
  </TablixColumnHierarchy>
  <TablixRowHierarchy>
    <TablixMembers>
      <TablixMember>
        <Group Name="Details" />
      </TablixMember>
    </TablixMembers>
  </TablixRowHierarchy>
```

The single column is set to be 5.5 inches wide; therefore, the tablix is going to be 5.5 inches wide.

```
  <TablixBody>
    <TablixColumns>
      <TablixColumn>
        <Width>5.5in</Width>
      </TablixColumn>
    </TablixColumns>
```

The single row specifies a single TablixCell—because there is only a single column—and this has a **Rectangle** in it. The rectangle has various controls in it. For each row of data, the cell is repeated vertically, each being 0.42 inches high. The rendered height of the tablix depends on how many rows of data are in the DataSet.

```
    <TablixRows>
      <TablixRow>
        <Height>0.42in</Height>
        <TablixCells>

3.8 ~~3.8~~ Tablix Example 2

The following is an example RDL definition of a Tablix element that is used to lay out data in a straightforward manner. The tablix uses text boxes within cells to format and display the data. This layout provides similar functionality to the Table element in versions of RDL prior to 2008/01. The data is fetched from the Microsoft Adventure Works example database. The top of the rendered definition is shown in the following figure.

The **Tablix** element has its Tablix.Name attribute set to "Tablix2". It is positioned 1 inch from the left edge of its container.

```
<Tablix Name="Tablix2">

The entire tablix should be rendered only if the value of the *ShowTable* parameter is set to false. If it is rendered, a page break is wanted before the tablix appears, and after the last row of the rendered tablix, another page break is wanted.

```
  <Visibility>

There are three static columns in this tablix, so there must be three TablixCell elements in each row (or fewer if one of the cells spans more than one column).

```
<TablixColumnHierarchy>
  <TablixMembers>
    <TablixMember />
    <TablixMember />
    <TablixMember />
  </TablixMembers>
</TablixColumnHierarchy>
```

The TablixRowHierarchy element specifies two rows. The first is a static row that is to be kept with the dynamic row that follows. This row is to behave as a column header. Therefore, the row has a TablixMember.KeepWithGroup element that has a value of After and a TablixMember.RepeatOnNewPage element that has a value of true.

```
<TablixRowHierarchy>
  <TablixMembers>
    <TablixMember>
      <KeepWithGroup>After</KeepWithGroup>
      <RepeatOnNewPage>true</RepeatOnNewPage>
    </TablixMember>
```

The second row is a detail group with a SortExpression that causes the data in the group to appear in order of city name, A–Z.

```
    <TablixMember>
      <Group Name="Details" />
      <SortExpressions>
        <SortExpression>
          <Value>=Fields!City.Value</Value>
        </SortExpression>
      </SortExpressions>
    </TablixMember>
  </TablixMembers>
</TablixRowHierarchy>
```

The three columns defined by the TablixColumnHierarchy are set up with specific widths.

```
<TablixBody>
  <TablixColumns>
    <TablixColumn>
      <Width>2in</Width>
    </TablixColumn>

    </TablixColumn>
    <TablixColumn>
      <Width>3cm</Width>
    </TablixColumn>
  </TablixColumns>
```

The first row is set to 0.3 inches high and contains three cells. Each cell has an aqua background and has a light gray border, created by setting the properties on the descendant text boxes. The text in each text box is set as a header to the columns, Address, City, and Country.

The second row is associated with the row hierarchy that is a detail group; it will therefore be repeated for each row of data. The row is set to 0.6 inches high, but this will increase if the data needs more space because the descendant Textbox elements have the Textbox.CanGrow element specified with a value of true. As with the headings, each cell will appear to have a solid, light gray border because each descendant text box has that border defined.

The following is an example RDL definition of a Tablix element used to lay out data in nested rows, repeating columns, and a sibling column. The tablix uses text boxes within cells to format and display the data. This layout encompasses the functionality of the Matrix element in versions of RDL prior to 2008/01 [MSFT-RDL200801]. The data is fetched from the Microsoft Adventure Works example database. The top of the rendered definition is shown in the following illustration.

The second dynamic column is grouping on the Order Date month. The DataSet contains data for only a single month. Therefore, the example renders only a single column for this **dynamic group**. The size of the **TablixHeader** element is equal to the sum of the sizes of the first dynamic column headers. This effectively means that the CellContents span two rendered header rows. The text box is colored pink.

A TablixCorner element is specified (colored lime in the preceding figure) to occupy the top left corner. Observe that there is no ability to specify width or heights within the **TablixCorner**. The width of the columns is defined by the size of the **TablixHeader** elements in the row hierarchy. The height of the rows is defined by the size of the **TablixHeader** elements in the column hierarchy.

```
<TablixCorner>
  <TablixCornerRows>
```

There are two TablixCornerRow elements specified. There must be two because of the rule that states the following:

"If a **TablixCorner** element is specified, the quantity of descendant **TablixCornerRow** elements in the tablix MUST equal the quantity of unique cumulative heights for each tablix column member of the tablix. 'Cumulative height' for a tablix column member is defined as the sum of the values of all TablixHeader.Size elements descendant of the tablix column member."

Column hierarchy	Size	Cumulative height
Tablix member (SalesPerson)	.43438	.43438
Tablix member "List Price"	.43438	.43438 +.45833 = .94721
Tablix member "Standard Cost"	.43438	.43438 +.45833 = .94721
Tablix member (SalesPerson)	.94721	.94721

Computation of quantity of TablixCornerRow elements

This table shows the structure of the **TablixHeaders** within the column hierarchy, identifying the size values. The cumulative height calculation shows the addition of the **RdlSize** with all of its parent's **RdlSizes**. There are two unique cumulative heights: these are .48438 and .94721. Therefore, there must be two **TablixCornerRow** elements.

There are two TablixCornerCell elements specified in each row. There must be two because of the rule that states:

"If a **TablixCornerRow** element is specified, the quantity of descendant **TablixCornerCell** elements in the tablix MUST equal the quantity of unique cumulative widths for each tablix row member of the tablix. 'Cumulative width' for a tablix row member is defined as the sum of the values of all **TablixHeader.Size** elements that are descendant of the tablix row member."

Row hierarchy	Size	Cumulative width
Tablix member (ProductCategoryName)	1.00000	1.00000
Tablix member "First order received"	1.76562	1.00000 + 1.76562= 2.76562
Tablix member (ProductName)	1.76562	1.00000 + 1.76562= 2.76562
Tablix member "Total"	1.76562	1.00000 + 1.76562= 2.76562

Tablix example 3—computation of quantity of TablixCornerCell elements

The preceding table shows the structure of the **TablixHeaders** within the row hierarchy, identifying the size values. The cumulative width calculation shows the addition of the size with all of its parent's sizes. There are two unique cumulative heights: these are 1.00000 and 1.76562. Therefore, there need to be two **TablixCornerCell** elements in each **TablixCornerRow** element.

The body of the tablix defines the cells that can repeat for both columns and rows. The widths of each TablixColumn specify the width of each column as it repeats.

The heights of each TablixRow specify the height of each row as it repeats.

3.10 ~~3.10~~ Data Example

The following is an example that shows how to define the data that will be used for the Report element. The example shows a DataSource and DataSet definition, including the Query, which has QueryParameters that reference ReportParameters, and the Fields for the **DataSet**, with one field being calculated based on two other fields in the **Fields** collection.

```
<DataSources>
 <DataSource Name="DataSource1">
   <ConnectionProperties>

3.11 ~~3.11~~ Subreport Example

The following RDL definition shows an example of a Subreport definition that would be used within a data region. The example includes specifying the location of the report definition to use for the subreport by specifying the path by using the Subreport.ReportName element. The report being referenced requires three report parameters to be supplied with values, which are specified by using the Subreport.Parameters element.

```
<Subreport Name="Subreport1">
  <ReportName>/Subreports/CustomerOrder.rdl</ReportName>
  <Parameters>
    <Parameter Name="CustomerID">
      <Value>=Fields!CustomerID.Value</Value>
    </Parameter>
    <Parameter Name="OrderID">
      <Value>=Fields!OrderID.Value</Value>
    </Parameter>
    <Parameter Name="ShowDetails">
      <Value>=(Count(Fields!OrderID.Value) < 5)</Value>
      </Parameter>
    </Parameters>
    <Top>0.69667in</Top>
    <Left>0.43625in</Left>
    <Height>2.61458in</Height>
    <Width>4.77083in</Width>
    <ZIndex>1</ZIndex>

3.12 ~~3.12~~ TextBox Example

The following is an example text box that was created by using the Textbox element.

Copyright © 2016 Microsoft Corporation

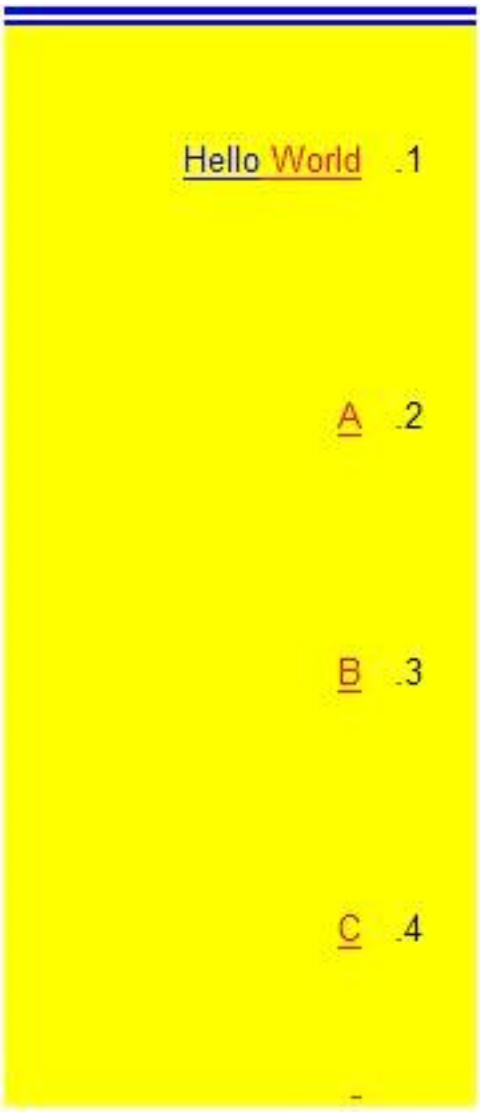

Figure 20: Text box example

The Name attribute of the **Textbox** element is set to "Textbox1". "Textbox1" has its Textbox.CanGrow element set to true. This means that, although the Textbox.Height element is set to only 0.72917 inches, extra spacing or padding introduced by other elements within "Textbox1" can make "Textbox1" grow vertically beyond 0.72917 inches. "Textbox1" contains four Paragraph elements within its Paragraphs collection.

```
<Textbox Name="Textbox1">
  <CanGrow>true</CanGrow>
  <KeepTogether>true</KeepTogether>
  <Paragraphs>
```

The first **Paragraph** in the **Paragraphs** collection for "Textbox1" contains two TextRun elements, which correspond separately to the words "Hello" and "World". The **TextRun** element that has TextRun.Value set to "Hello" has Style.Color set to "Blue". The **TextRun** element that has **TextRun.Value** set to "World" has **Style.Color** set to "Red".

```
<Paragraph>
  <TextRuns>
    <TextRun>
      <Value>Hello</Value>
      <Style>
        <Color>Blue</Color>
      </Style>
    </TextRun>
    <TextRun>
      <Value> World</Value>
      <Style>
        <Color>Red</Color>
      </Style>
    </TextRun>
  </TextRuns>
  <ListStyle>Numbered</ListStyle>
  <ListLevel>1</ListLevel>
```

Because Style.LineHeight is set to "1in", each **Paragraph** within "Textbox1" takes up at least one inch of vertical space. Because **Textbox.CanGrow** is set to true, "Textbox1" actually is much larger in height than its specified **Textbox.Height** value of 0.72971 inches.

"Textbox1" has a Style.TopBorder element with Border.Style set to "Blue", **Border.Style** set to "Double", and Border.Width set to "5pt". Because these properties are set only for **Style.TopBorder**, and no other Style border elements or a generic Style.Border element, the left, right, and bottom sides of "Textbox1" are not affected. This is shown in the figure at the beginning of this section. Additionally, "Textbox1" has Style.Direction set to "RTL", which is why the numbering in the list within "Textbox1" occurs to the right of the actual text.

3.13 ~~3.13~~ GaugePanel Example

The following is an example RDL definition of a GaugePanel element that is used to create the gauge panel shown in the following figure. The **GaugePanel** element has its Name attribute set to "GaugePanel3". "GaugePanel3" has the GaugePanel.DataSetName element set to "DataSet1". The DataSet named "DataSet1" exposes two Fields named "UnitsInStock" and "UnitsOnOrder" for "GaugePanel3" to use.

Figure 21: Gauge panel with single radial gauge

The gauge panel contains a single RadialGauges collection. This **RadialGauges** collection contains only one RadialGauge element. This **RadialGauge** element has its **Name** attribute set to "RadialGauge1".

```
<GaugePanel Name="GaugePanel3">

"RadialGauge1" contains only one RadialScale element within its RadialGauge.GaugeScales collection. This **RadialScale** element has its **Name** attribute set to "RadialScale1".

"RadialScale1" contains only one RadialPointer element within its RadialScale.GaugePointers collection. This **RadialPointer** element has its **Name** attribute set to "RadialPointer1". "RadialPointer1" has RadialPointer.GaugeInputValue set to "Sum(Fields!UnitsOnOrder.Value)", which means that the pointer will point at the value that is equal to the cumulative sum of all values for the "UnitsOnOrder" Field, which evaluates to a value between 500 and 1000.

"RadialScale1" contains only one ScaleRange element within its ScaleRanges collection. This **ScaleRange** element has its **Name** attribute set to "RadialRange1". "RadialRange1" has ScaleRange's Style.BackgroundGradientEndColor set to "Salmon" and ScaleRange's Style.BackgroundGradientType set to "DiagonalLeft". These settings affect the viewing layout of "RadialRange1", as seen in the previous figure. The width of "RadialRange1" varies from 15 percent of the radius of "RadialScale1" at the beginning of the range to 30 percent of the radius of "RadialScale1" at the end of the range. The actual values for "RadialRange1" go from 10 percent to 90 percent of the cumulative sum of all values for the "UnitsInStock" field.

"RadialScale1" has RadialScale.MinimumValue set to 0 and RadialScale.MaximumValue set to "=Sum(Fields!UnitsInStock.Value)". This means that the scale that is represented by "RadialScale1" can go from 0 to the cumulative total of all product units that are in stock as recorded by "DataSet1". This cumulative total is slightly greater than 3000.

The RadialScale.GaugeMajorTickMarks has TickMarkStyle.Placement set to "Outside" and no TickMarkStyle.Shape set. Therefore, the major tick marks, with their intervals defaulted to 500, are placed outside of "RadialScale1" and contain a slim (because TickMarkStyle.Width is set to only 2) rectangular shape.

3.14 ~~3.14~~ Line Example

The following example demonstrates an RDL Line element, which is shown in the following figure.

Copyright © 2016 Microsoft Corporation

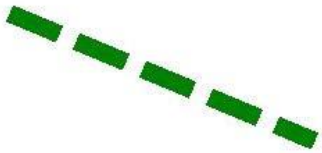

Figure 22: Line example

The Line.Name is set to "Line1". However, Line.Top is set to 1.25917in and Line.Left is set to 4in; Line.Height is set to "-0.95833in" and Line.Width is set to -2.29167in. This means that "Line1" starts from the lower-right end and goes to the upper-left end. The Style.Border element, along with its child elements, controls the appearance of "Line1". Border.Color is set to Green, Border.Style is set to "Dashed", and Border.Width is set to 10pt. These settings are reflected in the preceding figure.

```
<Line Name="Line1">
  <Top>1.25917in</Top>

3.15 ~~3.15~~ List Example

Applies to RDL schemas 2003/10 [MSFT-RDL200310] ***and 2005/01*** [MSFT-RDL200501] ***only***

The following example of a List element is an extract from an RDL specification of a report. This example is from a report for the AdventureWorks database. It shows a count of how many distinct products there are and the total quantity of products in inventory at different locations within the company in a list. This example illustrates the use of a **list data region** and how to group details by company location.

The following figure shows the **List** example. An instance of the list consists of the label "Location:" followed by the name of the location, the label "Number of Different Products:" followed by a count of the number of different products at that location, and the label "Total Quantity:" followed by the sum total number of products at that location. These six items appear as Textbox report items placed in free form within the boundaries of a list instance; that is, they are not aligned in any particular rows and columns. They can be placed anywhere within the list instance boundary. The background colors of two of the **Textbox** report items are set to LemonChiffon and LightGreen.

Figure 23: Example of a list with grouping

The following is the extract from the RDL report file that produces the preceding list. The **List** element has its Name attribute set to "list1". There is a Sorting element that specifies that this group is sorted by the Field "Name" in ascending order. As shown in the preceding figure, the locations listed are Debur and Polish, Final Assembly, Finished Goods Storage, and so on, which are sorted in alphabetical (ascending) order. The Left element specifies that the list is 0.125 inches from the left edge of the body of the report. The list is bound to the data in the DataSet "DataSet1" by the List.DataSetName element.

```
<List Name="list1">
  <Sorting>
    <SortBy>
      <SortExpression>=Fields!Name.Value</SortExpression>
      <Direction>Ascending</Direction>
    </SortBy>
  </Sorting>
  <Left>0.125in</Left>
  <DataSetName>DataSet1</DataSetName>
```

The ReportItems element specifies the six text boxes that comprise a single instance of list data. The text boxes that have the Name attribute values "textbox3", "textbox4", and "textbox5" are the labels before the data. The text box that has the **Name** attribute value "Name" is the name of the location in the company, and its Style.BackgroundColor element is specified as LemonChiffon. The text box that has the **Name** attribute value "textbox2" is the total quantity of products in this location in the company, and its **Style.BackgroundColor** element is specified as LightGreen. Note that its Value element is an expression that uses the Sum aggregate function. The text box that has the **Name** attribute value "textbox1" is the count of distinct products in this location in the company. Note that its **Value** element is an expression that uses the Count aggregate function.

The next elements specify that the **List** is 0.25 inches below the top of its container, which is the report body, and that **List** is 5.25 inches wide. The **Style** element specifies that the entire list is surrounded with a solid border in the default Black color.

The following Grouping element specifies that the details of the list are grouped by the field named "LocationID". This field is a numerical value that uniquely identifies each location name. Finally, the Height element specifies that each detail instance of the list is 0.5 inches tall.

```
    <Grouping Name="list1_Details_Group">

3.16 ~~3.16~~ Rectangle with Image and Textbox Example

The following figure shows an image that was created by using the Rectangle element and the Textbox element.

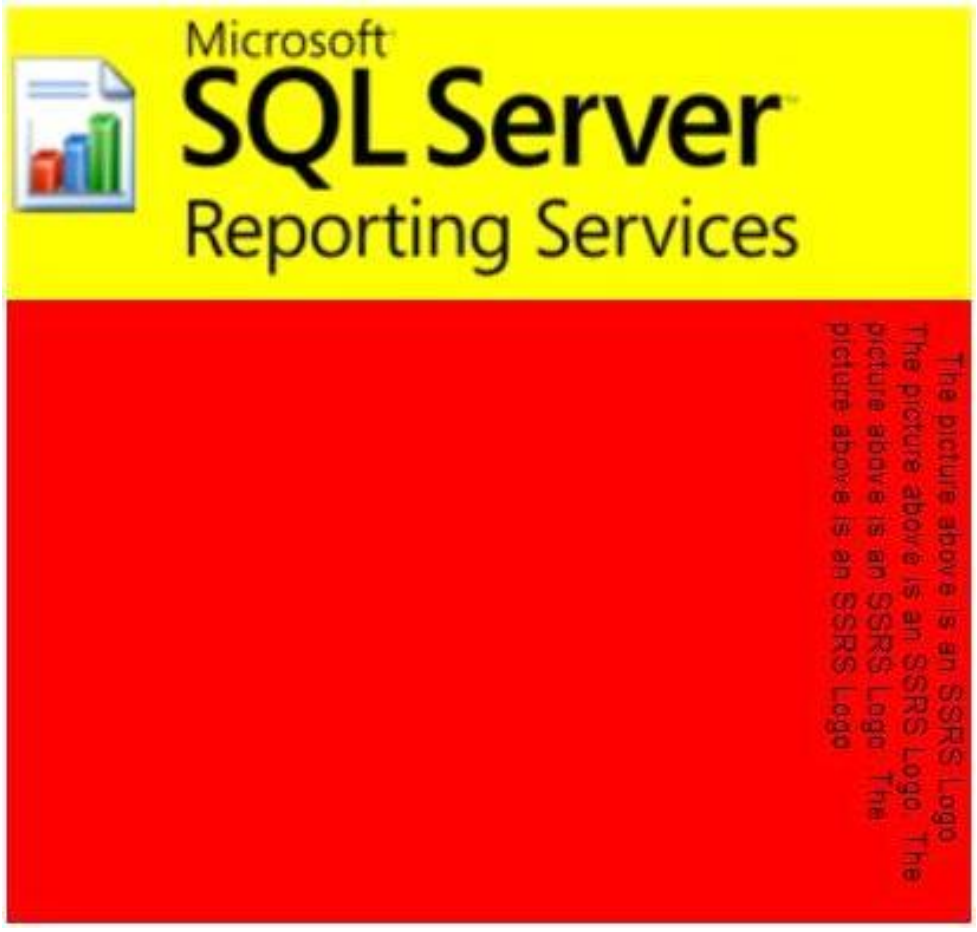

Figure 24: Rectangle with an image and a text box

The Name attribute of the **Rectangle** element is set to "Rectangle1". "Rectangle1" contains two child elements within its Rectangle.ReportItems collection: an Image element and a **Textbox** element.

The Name attribute of the **Image** element within "Rectangle1" is set to "Image2". Image.Source for "Image2" is set to External, which means that Image.Value expects an RdlURL value or an expression that evaluates to the location of an actual image. For "Image2", **Image.Value** is set to

http://www.widgets.microsoft.com/SSRSLogo.jpg, which stores the image shown above that shows an icon to the left and the words "Microsoft SQL Server Reporting Services" to the right.

```
<Rectangle Name="Rectangle1">
  <ReportItems>
    <Image Name="Image2">
      <Source>External</Source>
      <Value>http://widgets.microsoft.com/SSRSLogo.jpg</Value>

      <Height>1.26042in</Height>
      <Width>4.25in</Width>
      <Style>
        <Border>
          <Style>None</Style>
        </Border>
        <PaddingLeft>1pt</PaddingLeft>
        <PaddingRight>1pt</PaddingRight>
        <PaddingTop>1pt</PaddingTop>
        <PaddingBottom>1pt</PaddingBottom>
      </Style>
    </Image>
```

The Name attribute of the **Textbox** element within "Rectangle1" is set to "Textbox1". "Textbox1" is a simple text box. It contains only one Paragraph within its Textbox.Paragraphs collection. Within that one **Paragraph**, "Textbox1" contains only one TextRun within the Paragraph.TextRuns collection. Because Style.WritingMode is set to Vertical for "Textbox1", the text goes from up to down instead of from left to right.

The only **Paragraph** within "Textbox1" has Paragraph.LeftIndent set to 5pt and Paragraph.RightIndent set to 5pt. This causes the text within that **Paragraph** to be offset 5 points both to the left and right. However, because **Style.WritingMode** is set to Vertical, the offsets are instead applied to the top and bottom, respectively. Similarly, setting Paragraph.HangingIndent to 10pt additionally offsets the first line of text within the **Paragraph** 10 points from the top. Finally, because Textbox.CanGrow is set to true, both "Textbox1" and "Rectangle1" expand vertically beyond their respective heights of 0.65972 inches and 1.94792 inches.

```
    <Textbox Name="Textbox1">

    <Left>1.11333in</Left>
    <Height>1.94792in</Height>
    <Width>4.25in</Width>
```

"Rectangle1" has Style.BackgroundColor set to Yellow. This also applies to "Image2" because the **Image** that is associated with "Image2" contains a transparent background. However, because "Textbox2" has **Style.BackgroundColor** set to Red, the background of "Textbox2" is red instead of yellow, as shown in the preceding figure.

```
    <Style>
      <BackgroundColor>Yellow</BackgroundColor>
      <Border>
        <Style>None</Style>
      </Border>
    </Style>
  </Rectangle>
```

3.17 ~~3.17~~ Map Example

The following example report is a map that shows the results for the 2008 United States presidential election. The states are colored based on the winning candidate. This map also shows a bubble for each state. The bubble size is based on the number of electoral votes for each state.

Figure 25: Map example

The data source that is used in this report is "ElectionMap". Two datasets, "Spatial" and "Analytics", are defined in the report. The map report item contains one MapPolygonLayer that shows the map of the states.

The MapSpatialDataSet element within the layer describes how the spatial data is retrieved from the "Spatial" dataset. The MapSpatialDataSet.DataSetName element specifies the name of the dataset to be bound to. The MapSpatialDataSet.SpatialField element specifies the name of the field to use as the source for the spatial data. The MapFieldNames element specifies the name of the non-spatial fields to associate with the spatial elements. (Typically, these fields are used to join the spatial elements to the analytical dataset.)

The MapDataRegion element named "Map1_PolygonLayer1_DataRegion" specifies the source for analytical data. In this case, the source is the "Analytics" dataset. The MapMember element specifies how the rows in the dataset are grouped. In this case, the data is grouped by state by the group expression =Fields!State.Value.

After the spatial data and the analytical data are defined, the MapBindingFieldPairs element specifies how these data are joined together. Each MapBindingFieldPair element specifies a FieldName from the spatial data and a BindingExpression from the analytical data. If all the pairs match, the spatial element is bound to the analytical data.

Next is the role of the rules by which to visualize the analytical data. The polygon layer contains a MapPolygonRules element that has a MapColorRangeRule. This rule specifies the range of color to use to colorize the shapes, and a DataValue element to choose which field to visualize (in this case, =Fields!Winner.Value).

To display the bubble for the number of electoral votes, a MapPolygonLayer.MapCenterPointRules element is defined in the layer together with the MapSizeRule element. The **MapSizeRule** element controls the size of the bubbles based on the expression =Sum(Fields!ID_EV.Value).

3.18 ~~3.18~~ Matrix Example

Applies to RDL schemas 2003/10 [MSFT-RDL200310] ***and 2005/01*** [MSFT-RDL200501] ***only***

The following example of a Matrix element is an extract from an RDL specification of a report. This example is from a report for the Adventure Works database and shows sales by quarter and product category. This example illustrates the use of a **matrix data region** that provides drilldown from summary data into detail data by showing and hiding rows. The following figures show the matrix in its collapsed state and in a partially expanded state.

The following figure shows the **Matrix** example in its collapsed state. The row headers are the product categories Components, Clothing, Bikes, and Accessories. They are sorted in descending order. The column headers are the years 2002 and 2003; they are sorted in ascending order. The detail cells contain sales data that represent the sum total of all sales for a given category and year. Clicking a plus sign in the category row headers or year column headers expands the row or column to drill down into the data.

	2002	2003
Components	$3,611,041	$5,489,741
Clothing	$489,820	$1,024,474
Bikes	$26,664,534	$35,199,346
Accessories	$93,797	$595,014

Figure 26: Example of a matrix with dynamic columns in collapsed state

The following figure shows the **Matrix** example in a partially expanded state. In the Bikes category, a row header is expanded to show the three subcategories of Mountain Bikes, Road Bikes, and Touring Bikes. Also, the column header 2003 is expanded to show the four quarters of 2003. The cell data now represents the sum total of all sales per subcategory and quarter for those cells that are in a subcategory row and under a quarter column. In a partially expanded matrix, there are also details cells that present data at a higher summarization level. For example, the value $262,613 is the sum total of all sales for all subcategories of Accessories for the third quarter of 2003. This is because the row Accessories is not expanded.

Figure 27: Example of a matrix with dynamic columns in partially expanded state

The following is the extract from the RDL report file that produces the matrix that is shown above. The **Matrix** element has its Name attribute set to "SalesMatrix". It has a single MatrixColumn in the MatrixColumns collection that specifies the width of the cells of the detail data to be 0.875 inches. The matrix is bound to the data in the DataSet "Sales" by the Matrix.DataSetName element.

```
<Matrix Name="SalesMatrix">
  <MatrixColumns>
    <MatrixColumn>
      <Width>0.875in</Width>
    </MatrixColumn>
  </MatrixColumns>
  <DataSetName>Sales</DataSetName>
  <RowGroupings>
```

This matrix has two RowGrouping elements in its RowGroupings collection. This is an ordered list specifying the groupings from outermost to innermost. The first **RowGrouping** element specifies a grouping by category. The width of this **RowGrouping** is set to 1.125 inches, which is the width of the expanded row header cell containing "Bikes" in the preceding figure.

The first **RowGrouping** element has a DynamicRows element that specifies the content of the row header along with grouping and sorting information. The Textbox with Name attribute "Category" has a Style element that specifies that the row header value should be white lettering on a steel blue background. The values that should be displayed as row headers come from the Field named "ProdCat" as is specified in the Value element of the **Textbox** as the expression =Fields!ProdCat.Value.

There is a Grouping element with its Name attribute set to "ProductCategory" that specifies that the data is grouped by the expression "=Fields!ProdCat.Value"; that is, the data is grouped by the "ProdCat" **Field**. Also, there is a Sorting element that specifies that this group is sorted by the "ProdCat" **Field** in descending order. This is seen in the preceding figure where the categories listed are Components, Clothing, Bikes, and Accessories, which are sorted in reverse alphabetical (descending) order.

```
    <RowGrouping>

            <PaddingRight>2pt</PaddingRight>
            <BackgroundColor>SteelBlue</BackgroundColor>
          </Style>
          <ZIndex>2</ZIndex>
          <Value>=Fields!ProdCat.Value</Value>
        </Textbox>
      </ReportItems>
      <Grouping Name="ProductCategory">
        <GroupExpressions>
          <GroupExpression>=Fields!ProdCat.Value</GroupExpression>
        </GroupExpressions>
      </Grouping>
      <Sorting>
        <SortBy>
          <SortExpression>=Fields!ProdCat.Value</SortExpression>
          <Direction>Descending</Direction>
        </SortBy>
      </Sorting>
    </DynamicRows>
  </RowGrouping>
```

The second **RowGrouping** element specifies a grouping by subcategory. The width of this **RowGrouping** is set to 1.125 inches, which is the width of the row header cell containing Mountain Bikes in the figure. This **RowGrouping** element has a **DynamicRows** element that specifies the content of the row header along with grouping and sorting information. The **Textbox** with **Name** attribute "SubCategory" has a **Style** element that specifies that the row header value should be white lettering on a steel blue background. The values to display as row headers come from the **Field** named "SubCat" as is specified in the **Value** element of the **Textbox** as the expression =Fields!SubCat.Value.

This element has something that the previous **RowGrouping** does not have. It has the Visibility element, which specifies that this row grouping should initially be hidden and that the **RowGrouping** that has the **Name** attribute "Category" is used to toggle whether this row grouping is visible or hidden—that is, expanded or collapsed.

The **Grouping** element that has the **Name** attribute "ProductSubcategory" specifies that the data is grouped by the expression =Fields!SubCat.Value, that is, grouped by the **Field** "SubCat". Also, a **Sorting** element specifies that this group is sorted by the **Field** "SubCat" in ascending order. This is shown in the figure where the subcategories are Mountain Bikes, Road Bikes, and Touring Bikes, which are sorted in alphabetical (ascending) order.

```
<RowGrouping>
  <Width>1.125in</Width>
  <DynamicRows>
    <Visibility>
      <Hidden>true</Hidden>
      <ToggleItem>Category</ToggleItem>
    </Visibility>

        </Style>
        <ZIndex>1</ZIndex>
        <Value>=Fields!SubCat.Value</Value>
      </Textbox>
    </ReportItems>
    <Grouping Name="ProductSubcategory">

          <GroupExpressions>
            <GroupExpression>=Fields!SubCat.Value</GroupExpression>

        </Grouping>
        <Sorting>
          <SortBy>
            <SortExpression>=Fields!SubCat.Value</SortExpression>
            <Direction>Ascending</Direction>
          </SortBy>
        </Sorting>
      </DynamicRows>
    </RowGrouping>
  </RowGroupings>
  <MatrixRows>
```

This matrix has a single MatrixRow element in its MatrixRows collection. This **MatrixRow** has a single MatrixCell element in its MatrixCells collection. The **Textbox** specifies the content of the details cells of the matrix. It sets the background color to white; the content of the details is an aggregate expression that computes the total sales under the current row headers and column headers of the details cell. That aggregate is specified by the expression =Sum(Fields!Sales.Value).

The height of this **MatrixRow** is set to 0.25 inches, which is the height of a detail cell such as the one containing $283,928 in the figure.

Additionally, just after the **MatrixRows** element, the **Top** element specifies that the matrix is placed 1.0625 inches below the top of its parent report item.

    <MatrixRow>

            <Textbox Name="Sales">

      <Height>0.25in</Height>
    </MatrixRow>
  </MatrixRows>

  <ColumnGroupings>
```

This matrix has two ColumnGrouping elements in its ColumnGroupings collection. This is an ordered list that specifies the groupings from outermost to innermost. The first **ColumnGrouping** element specifies a grouping of sales orders by year. The height of this **ColumnGrouping** is set at the end of this element to 0.25 inches, which is the height of the expanded column header cell containing 2003 in the figure. This element has a DynamicColumns element that specifies the content of the column header, along with grouping and sorting information. The **Textbox** that has its **Name** attribute set to "OrderYear" has a **Style** element that specifies that the column header value should be white lettering on a steel blue background. The values to display as column headers come from the **Field** named

"OrderYear" as is specified in the **Value** element of the **Textbox** as the expression =Fields!OrderYear.Value.

A **Grouping** element with its **Name** attribute set to "OrderYear" specifies that the data is grouped by the expression =Fields!OrderYear.Value. That is, the data is grouped by the "OrderYear" **Field**. Also, there is a **Sorting** element that specifies that this group is sorted by the "OrderYear" **Field** in ascending order. This is shown in the preceding figure in which the years that are listed are 2002 and 2003, which are sorted in ascending order.

```
<ColumnGrouping>

        <Direction>Ascending</Direction>
      </SortBy>
    </Sorting>
  </DynamicColumns>
  <Height>0.25in</Height>
</ColumnGrouping>
```

The second **ColumnGrouping** element specifies a grouping of the sales orders by quarter. The height of this **ColumnGrouping** is set at the end of this element to 0.25 inches, which is the height of the column header cell containing "Q1" in the preceding figure. This **ColumnGrouping** element has a **DynamicColumns** element that specifies the content of the column header, along with grouping and sorting information. The **Textbox** that has its **Name** attribute set to "OrderQuarter" has a **Style** element that specifies that the column header value should be white lettering on a steel-blue background. The values to display as column headers come from the **Field** named "OrderQtr"; this is specified in the **Value** element of the **Textbox** as the expression =Fields! OrderQtr.Value.

This element also has a **Visibility** element, which specifies that this column grouping is initially hidden and that the **ColumnGrouping** that has the **Name** attribute "OrderYear" is used to toggle this column grouping between visible or hidden, that is, expanded or collapsed.

The **Grouping** element that has the **Name** attribute "OrderQtr" specifies that the data is grouped by the expression =Fields!OrderQtr.Value; that is, the data is grouped by the **Field** "OrderQtr". Also, there is a **Sorting** element that specifies that this group is sorted by the **Field** "OrderQtr" in ascending order. This is shown in the figure in which the quarters listed are Q1, Q2, Q3, and Q4, which are sorted in alphabetical (ascending) order.

This matrix has a Corner element that consists of a **Textbox** that has no value. Since this **Textbox** does not have a border and has no value, the upper-left corner of the matrix is blank. Just preceding this **Corner** element is the Width element, which specifies that the initial width of the matrix is 3.125 inches. The actual width of the matrix is derived from the sum of the widths of the component row and column headers.

The Height element specifies that the initial height of the matrix is 0.75 inches. The actual height of the matrix is derived from the sum of the heights of the component row and column headers. The Left element specifies that the table is placed 0.0625 inches to the right of the left edge of the parent report item that contains this matrix.

3.19 ~~3.19~~ Table Example

Applies to RDL schemas 2003/10 [MSFT-RDL200310] ***and 2005/01*** [MSFT-RDL200501] ***only***

The following example of a Table element is an extract from an RDL specification of a report. This example is from a report for the Adventure Works database and shows year-to-date (YTD) sales and last year's sales for each salesperson grouped by region and sales territory. This example illustrates the use of a table data region to provide a tabular grouped listing of data in a grid, providing subtotals for each of the two groups and a grand total for the whole table.

The following figure shows the **Table** example. The first and last rows of the table have a dark blue background color. These are the header and footer rows of the table. The header provides column headers and the footer provides grand totals of YTD sales and last year's sales. The rows with the medium blue background color present subtotals of sales for all the territories within a region. The rows with the light blue background color present the subtotals of sales for all the salespersons within a territory. The rows with the white background color are the detail rows of the table, which provide the sales information for each salesperson.

Figure 28: Example of a table with grouping and totals rows

The following is the extract from the RDL report file that produces the preceding table. The **Table** element has its **Name** attribute set to "table1". The table is bound to the data in the DataSet AdventureWorks by the Table.DataSetName element. The Top element specifies that the table is 0.33 inches from the top edge of its containing report item, which is the body of the report.

<TableGroups>
```

This table has two TableGroup elements in its TableGroups collection. This is an ordered list that specifies the groupings from outermost to innermost. The first **TableGroup** element specifies a grouping by region.

The Grouping element that has its **Name** attribute set to "table1_Region" that specifies that the data is grouped by the expression =Fields!Region.Value; that is, the data is grouped by the Field "Region". The Sorting element specifies that this group is sorted by the **Field** "Region" in ascending order. This is shown in the figure where the regions listed are Europe, North America, and Pacific, which are sorted in alphabetical (ascending) order.

```
<TableGroup>
  <Grouping Name="table1_Region">
    <GroupExpressions>
      <GroupExpression>=Fields!Region.Value</GroupExpression>
    </GroupExpressions>
  </Grouping>
  <Sorting>
    <SortBy>
      <SortExpression>=Fields!Region.Value</SortExpression>
      <Direction>Ascending</Direction>
    </SortBy>
  </Sorting>
```

The Footer element of the **TableGroup** specifies the rows in the figure that are medium blue in color. These are the lines that represent the total sales for all territories in a region. The Textbox that has its **Name** attribute value set to "textbox7" specifies the Total label. The text boxes with **Name** attribute values "textbox10" and "textbox11" specify expressions by using the aggregate function Sum to total all the YTD and last year's sales values in this grouping scope.

The second **TableGroup** element in the following RDL specifies a grouping by sales territory. There is a **Grouping** element with the **Name** attribute "table1_Sales_Territory" that specifies that the data is grouped by the expression =Fields! Sales_Territory.Value; that is, the data is grouped by the **Field** "Sales_Territory". A **Sorting** element specifies that this group is sorted by the **Field** Sales_Territory in ascending order. This is shown in the figure where the sales territories listed are France, Germany, and United Kingdom, under the region Europe, and these are sorted in alphabetical (ascending) order.

```
<TableGroup>
  <Grouping Name="table1_Sales_Territory">

      <Direction>Ascending</Direction>
    </SortBy>
  </Sorting>
```

The **Footer** element of this **TableGroup** specifies the rows in the figure that are light blue in color. These are the lines that represent the total sales for all salespersons within a sales territory. The **Textbox** with the **Name** attribute value "textbox13" specifies the label "subtotal". The text boxes with **Name** attribute values "textbox15" and "textbox16" specify expressions by using the aggregate function **Sum** to total all the YTD and last year's sales values in this grouping scope.

The Details element of this **Table** specifies the rows in the figure that have a white background color. These are the rows that represent the details of sales for each salesperson within a sales territory. The text boxes with the **Name** attribute values "Region" and "Sales_Territory" specify the values of the region and sales territory for a given salesperson. The Textbox.HideDuplicates element specifies that only the first occurrence of each of these will appear within their respective groups. This is why the values North America and Canada are not repeated for the details row for salesperson Garrett R Vargas in the figure. The **Textbox** with the **Name** attribute value "Sales_Person" specifies the name of the salesperson. The remaining two text boxes specify the salesperson's YTD sales and last year's sales.

The following **Sorting** element specifies that the details are sorted by the **Field** "LastName" in ascending order. We see this in the preceding figure where the salespersons in the Northwest Territory of the North America region are Pamela O Ansman-Wolfe, David R Campbell, and Tete A Mensa-Annan, who are sorted in alphabetical (ascending) order by their last name. Note that the **Field** "Sales_Person" is not used to sort the details because this would sort the salespersons by their full name, which would sort them by their first name.

```
    <Sorting>
      <SortBy>
        <SortExpression>=Fields!LastName.Value</SortExpression>
        <Direction>Ascending</Direction>
      </SortBy>

4 ~~4~~ Security ~~Considerations~~

Because Report Definition Language contains only metadata about the report, there are no security considerations for the RDL file itself. Products that implement report processing using RDL as a basis should, however, be aware of the inherent security risks in the execution of the arbitrary Visual Basic.Net expressions, custom code, and external class references contained within the report.

5 ~~5~~ Appendix A: RDL XML Schemas

For ease of implementation, the following sections provide the full XML Schemas for this protocol.

Schema name	Prefix	Section
RDL XML Schema for Version 2003/10	xsd	5.1
RDL XML Schema for Version 2005/01	xsd	5.2
RDL XML Schema for Version 2008/01	xsd	5.3
RDL XML Schema for Version 2010/01	xsd	5.4
RDL XML Schema for Version 2011/01	xsd	5.5
RDL XML Schema for Version 2012/01	xsd	5.6
RDL XML Schema for Version 2013/01	xsd	5.7
RDL XML Schema for Version 2016/01	xsd	5.8

Note The RDL XML Schemas for versions 2011/01, 2012/01, and 2013/01 are not standalone schemas, but are dependent on the RDL XML Schema for version 2010/01.

<~~180~~182> Section 2.~~325~~329.13: In the file format validation implementation in SQL Server 2012 Reporting Services ~~and~~, SQL Server 2014 Reporting Services, and SQL Server 2016 Reporting Services, the behavior of **DateTime** values that specify dates before ~~"~~"March 1, 1900", is undefined when **DataSet.NullsAsBlanks** is true.

<~~181~~183> Section 2.~~328~~332.5: In SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services, **Field.AggregateIndicatorField** cannot be present when Field.Value is present. If **Field.AggregateIndicatorField** refers to a Field in which the **Field.Value** element is present, **Field.Value** on the referenced **Field** has to be a Boolean constant, and **Field.Vaue.DataType** on the referenced **Field** has to be Boolean.

<~~182~~184> Section 2.~~336~~340: The file format validation implementation in SQL Server 2012 Reporting Services ~~and~~, SQL Server 2014 Reporting Services, and SQL Server 2016 Reporting Services requires that a **DefaultRelationship** does not contain a circular reference

<~~183~~185> Section 2.~~336~~340: The file format validation implementation in SQL Server 2012 Reporting Services ~~and~~, SQL Server 2014 Reporting Services, and SQL Server 2016 Reporting Services requires that **DefaultRelationship** specifies a **JoinCondition**.

<~~184~~186> Section 2.~~336~~340.1: The file format validation implementation in ~~the~~ SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services restricts the value of the **DefaultRelationship.RelatedDataSet** element. This element has to be one of the **Dataset.Name** attribute values of the Report. **RelatedDataSet** has to be unique among the **RelatedDataSet** that are specified for other DefaultRelationship elements within the list of DefaultRelationships in a dataset. **RelatedDataSet** cannot be equal to the containing **DataSet.Name**.

<~~185~~187> Section 2.~~336~~340.2: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that the **DefaultRelationship.JoinConditions** element is specified unless **DefaultRelationship.NaturalJoin** is true and the **DefaultRelationship** is used to correlate instances of a group scope with its containing **DataRegion**.

<~~186~~188> Section 2.~~336~~340.3: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that when the **DefaultRelationship.NaturalJoin** element is specified for **DefaultRelationship** and that the value of the **DefaultRelationship.NaturalJoin** element is not specified as false.

<~~187~~189> Section 2.~~336~~340.3: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that when two **DataRegions** elements both specify a **Relationship** element and both **DataRegions** elements are within the same top level **DataRegion** element, both **DataRegions** elements cannot reference the same **DataSet** element.

<~~188~~190> Section 2.~~338~~342.1: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services restricts the content of **JoinCondition.ForeignKey**. This element cannot contain a reference to a **ReportItem** object, a **Variable** element, or a **RunningValue**, **Previous** or any other aggregate function.

<~~189~~191> Section 2.~~338~~342.2: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services restricts the content of **JoinCondition.PrimaryKey**. This element cannot contain a reference to a **ReportItem** object, a **Variable** element, **RunningValue**, **Previous**, or any other aggregate function.

<~~190~~192> Section 2.~~340~~344: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that if a **Relationship** element for a data scope specifies **NaturalJoin**, the containing **Relationship**

has to specify **NaturalJoin**. **NaturalJoin** is effective only if all containing **Relationship** elements specify **NaturalJoin**.

<~~191~~193> Section 2.~~340~~344: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that when two **DataRegions** both specify a **Relationship** that is within the same top-level **DataRegion** element, both **DataRegions** elements cannot reference the same **DataSet** element.

<~~192~~194> Section 2.~~340~~344: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that when two **DataRegions** elements specify a **Relationship** element in which one **DataRegions** element is the descendant of the other, both **DataRegions** elements cannot reference the same **DataSet** element.

<~~193~~195> Section 2.~~340~~344: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that **Relationship** specify **JoinCondition**. If **JoinCondition** is not specified, **DefaultRelationship** of **DataSet** that **ParentScope** is bound to has to specify **JoinCondition**.

<~~194~~196> Section 2.~~340~~344.2: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that when the **Relationship.NaturalJoin** element is specified for **Relationship**, the containing data scope has to specify that **NaturalGroup**. **NaturalJoin** is only effective if all containing groups specify **NaturalGroup**.

<~~195~~197> Section 2.~~340~~344.3: The file format validation implementation in SQL Server 2012 Reporting Services, SQL Server 2014 Reporting Services, and SQL Server ~~2014~~2016 Reporting Services requires that **Relationship.JoinConditions** be specified unless **Relationship.NaturalJoin** is true and **Relationship** is used to correlate instances of a group scope with its containing **DataRegion**.

<~~196~~198> Section 2.~~341~~345.3: The following namespaces and classes are available:

- **Microsoft.VisualBasic**
- **System.Convert**
- **System.Math**
- **System**

These standard namespaces specify frequently needed functionality as specified in [~~MS~~MSFT-VBNET].

<~~197~~199> Section 2.~~341~~345.4: In the Microsoft implementation, the following table specifies how expression return types are converted to RDL data types.

RDL Type	CLR Types
String	**String**, **Char**, **GUID**
Boolean	**Boolean**
Integer	**Int16**, **Int32**, **Int64**, **UInt16**, **UInt32**, **UInt64**, **Byte**, **SByte**, **TimeSpan** The implementation of Reporting Services can convert **Integer** expression results to 32-bit or 64-bit precision, depending on the usage context.
DateTime	**DateTime**, **DateTimeOffset**
Float	**Single**, **Double**, **Decimal**
Binary	**Byte[]**

RDL Type	CLR Types
Variant	One of the following RDL types: **String**, **Boolean**, **Integer**, **DateTime**, **Float**, or **Binary**.
VariantArray	Array of **Variant**. Unless otherwise specified, in the Microsoft implementation, this is a true variant array (that is, object[]), not a strongly typed array.
StringArray	Array of **String**
Numeric	One of the following RDL types: **Integer** or **Float**.
Scalar	One of the following RDL types: **Integer**, **Float**, or **DateTime**.
Serializable	An RDL **Variant**, which is a CLR type that is marked with **Serializable** [ECMA-335:2012], or a CLR type that implements **ISerializable**.

<200> Section 2.~~341~~345.6.5: In the Microsoft implementation, only text box items appear as **ReportItem** objects in the **ReportItems** collection. In third-party implementations, other items can appear in the **ReportItems** collection.

<~~199~~201> Section 2.~~341~~345.6.6: The **Name** property is set to "RPL" if the current user request does not use a rendering extension (such as a create history snapshot or toggle event).
