Report Server Web Service for Report Management: ReportService2010

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, ~~IDL's~~IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, ~~email-~~mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

1 ~~1~~ Introduction

The Report Server Web Service for Report Management: ReportService2010 protocol is an API protocol that is provided by the ReportService2010 web service for managing objects and settings on a **report server**.

~~1.1~~ Glossary

~~The Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.~~

1.1 Glossary

~~This document uses the following terms ~~are defined in [MS-GLOS]:~~:~~

~~SOAP header
SOAP message
WSDL message
WSDL operation
XML namespace~~

~~The following terms are specific to this document:~~

report server: A location on the network to which clients can connect by using SOAP over HTTP or SOAP over HTTPS to publish, manage, and execute reports.

SOAP header: A mechanism for implementing extensions to a **SOAP message** in a decentralized manner without prior agreement between the communicating parties. See [SOAP1.2-1/2007] section 5.2 for more information.

SOAP message: An XML document consisting of a mandatory SOAP envelope, an optional **SOAP header**, and a mandatory SOAP body. See [SOAP1.2-1/2007] section 5 for more information.

WSDL message: An abstract, typed definition of the data that is communicated during a **WSDL operation** [WSDL]. Also, an element that describes the data being exchanged between web service providers and clients.

WSDL operation: A single action or function of a web service. The execution of a WSDL operation typically requires the exchange of messages between the service requestor and the service provider.

XML namespace: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as ~~described~~defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

~~1.2~~ References

1.2 References

~~Links to a document in the Microsoft Open Specifications documentation do not include a publishing year because links are to the latest~~library point to the correct section in the most recently published version of the referenced document. However, because individual documents, which in the library are not updated frequently. References to other documents include a publishing year when one is

available at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

~~1.1.1~~1.2.1 ~~1.2.1~~ Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

~~1.3 Overview~~

1.3 Overview

The ReportService2010 web service protocol that is described in this document provides methods for managing objects and settings on a report server [MSDN-~~SS2008RS~~]. ~~Objects and settings that can be managed by the protocol include the following: [SSRS](#).~~

~~Objects and settings that can be managed by the protocol include the following:~~

- ~~Security tasks, roles, and policies~~
- ~~Data source connections and credentials~~
- ~~Shared datasets~~
- ~~Reusable report components~~
- ~~Parameters for reports~~
- ~~Report execution and caching~~
- ~~Report history snapshots~~
- ~~Schedules~~
- ~~Subscriptions and deliveries of reports~~
- ~~Linked reports~~
- ~~Server system properties~~

Typically, the client establishes a connection with the server. After the connection is established by using the HTTP [RFC2616] or HTTPS [RFC2818] protocol, **SOAP messages** [~~SOAP1.1~~ [WSDL](#) [SOAP1.1](#)] [~~SOAP1.2~~ [WSDL](#) [SOAP](#)] are used to communicate between the client and the server.

The ReportService2010 web service protocol uses the security facilities that are built into HTTP or HTTPS for authentication and identification and for channel encryption negotiation. The protocol uses the facilities that are built into SOAP for specification of requests from client to server and for returning data from the server to the client. The following diagram depicts a (simplified) typical flow of communication in the protocol.

Figure 1-1: Communication flow for ReportService2010

Each method in the protocol is a SOAP operation that accepts a set of parameters as a SOAP request and returns a set of values as a SOAP response. The client sends a request to the server through a SOAP request message, and the server sends return values to the client through a SOAP response message.

The following procedure describes a simple example client/server exchange for creating a report.

1. **1.**—The client calls the **CreateCatalogItem** method, which accepts the following parameters:
 - **ItemType:** The type of the new item, such as "Report".
 - **Name:** The name of the item to create.
 - **Parent:** The full path name of the parent folder to which to add the report.
 - **Overwrite:** A **Boolean** expression that indicates whether an existing report with the same name in the specified location should be overwritten.
 - **Definition:** The item definition to publish to the report server.
 - **Properties:** An array of **Property** objects [MSDN-PropertyClass2010] that contains the property names and values to set for the report.
2. **2.**—The server creates the report, modifies the **ModifiedBy** and **ModifiedDate** properties of the parent folder, and then returns an array of **Warning** objects [MSDN-WarningClass2010] as an

output parameter and **CatalogItem** [MSDN-CatalogItemClass] as the return value to the client. **CatalogItem** describes any warnings that occurred when the report definition was validated.

Note If errors occur, the report is not created.

~~1.21.4 1.4~~ Relationship to Other Protocols

This protocol uses SOAP over HTTP as shown in the following layering diagram.

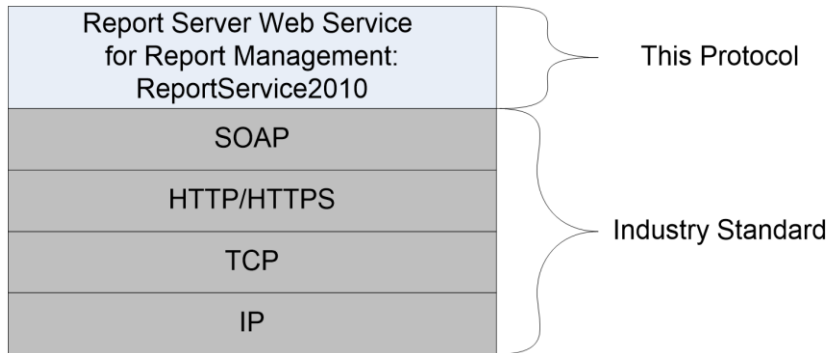

Figure 2: SOAP over HTTP

~~This protocol uses SOAP over or HTTPS as shown in the following layering diagram.~~

~~Figure 3: SOAP over HTTPS~~

~~1.31.5 1.5~~ Prerequisites/Preconditions

The ReportService2010 web service operates against a URL. The URL is identified by protocol clients. The protocol server endpoint is formed by appending "/ReportService2010.asmx" to the URL, as in the following example:

http://www.contoso.com/ReportServer/ReportService2010.asmx

It is assumed that authentication has been performed by the underlying protocol. The account that accesses this web service is assigned with proper permissions to the site and its items.

~~1.41.6 1.6~~ Applicability Statement

The ReportService2010 web service enables client applications to create and manage objects and settings on a report server.

~~1.51.7 1.7~~ Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

Supported Transports: The ReportService2010 web service protocol uses multiple transports with SOAP as specified in section 2.1.

Protocol Versions: This protocol has only one WSDL, as provided in Appendix A. Methods are described in section 2.2.2, and types are described in section 2.2.3.

~~1.6~~1.8~~1.8~~—Vendor-Extensible Fields

None.

~~1.7~~1.9~~1.9~~—Standards Assignments

None.

2 ~~2~~ Messages

2.1 ~~Transport~~

2.1 Transport

Protocol servers MUST support SOAP over HTTP and MUST support SOAP over HTTPS for securing communication with clients.

Protocol messages MUST be formatted as specified in [\[WSDLSOAP1.1\]](#) section 4 ~~of [SOAP1.1]~~ or [\[WSDLSOAP\]](#) section 3 ~~of [SOAP1.2]~~.<1>

2.2 ~~Messages~~

2.2 Messages

This section defines the messages that are used by this protocol. The syntax of the definitions uses XML Schema as defined in [XMLSCHEMA1] and [XMLSCHEMA2] as well as Web Services Description Language (WSDL) as defined in [WSDL].

The following information describes the steps by which the API is mapped to structures and operations in the web service.

Each class in the ReportService2010 web service [MSDN-RSWS2010], except the one that is derived from **System.Web.Services.Protocols.SoapHttpClientProtocol**, becomes one WSDL type. The following rules apply:

- ~~Non-inherited~~ public properties become elements in the type, with the following exceptions and additional rules:
 - ~~Any~~ property named *AnyAttr* becomes the XSD **anyAttribute** in the type rather than an element.
 - ~~If~~ the name of a property is the concatenation of the name of another property in the same class and "Specified", an element is not created for the former property in the type. The **minOccurs** attribute of the element for the latter property is 0. For other properties, the **minOccurs** attribute is 1 unless the API data type is **String**, **Byte[]**, or an array type, in which case the **minOccurs** attribute is 0.
 - ~~The~~ **maxOccurs** attribute of the element is 1 for nonarray types and "unbounded" for array types.
- ~~If~~ the class inherits another class in the web service, the WSDL type of the inherited class becomes an XSD extension in the WSDL type that corresponds to the inheriting class.

Each enumeration in the web service becomes one WSDL type as an XSD enumeration.

Each class that inherits **System.Web.Services.Protocols.SoapHeader** [MSDN-SoapHeader] becomes one **SOAP header**.

Each method in the class derived from **System.Web.Services.Protocols.SoapHttpClientProtocol** that is not derived from a base method in a base class or an interface becomes one **WSDL operation** with a corresponding SOAP operation, a request **WSDL message**, a response WSDL message, and corresponding WSDL types. The following rules apply:

- ~~Out~~ parameters and return values of the method become elements in the WSDL type for the response WSDL message.

- Other parameters of the method become elements in the WSDL type for the request WSDL message.
- If the method uses a SOAP header, the WSDL operation contains a WSDL message that has a single part of the WSDL type that corresponds to the SOAP header.

An array of a class becomes a WSDL type with an element of the WSDL type that corresponds to the class.

The primitive data types that are used by the API are mapped to WSDL XML Schema types as described in the following table.

API primitive data type	WSDL XML Schema type
Byte[]	base64Binary
Boolean	boolean
SByte	byte
Double	double
DateTime	dateTime
Decimal	decimal
Single	float
Int32	int
Int64	long
XmlQualifiedName	QName
Int16	short
String	string
Byte	unsignedByte
UInt32	unsignedInt
UInt64	unsignedLong
UInt16	unsignedShort

The result of this mapping can be found in the full WSDL in Appendix A of this specification.

2.2.1 Namespaces

2.2.1 Namespaces

The Report Server Web Service for Report Management: ReportService2010 document specifies and references various **XML namespaces** by using the mechanisms that are specified in [XMLNS]. Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference
soap	http://schemas.xmlsoap.org/wsdl/soap/	[WSDLSOAP1.1]

Prefix	Namespace URI	Reference
tns	http://schemas.microsoft.com/sqlserver/reporting/2010/03/01/ReportServer	Defined in Appendix A of this document.
s	http://www.w3.org/2001/XMLSchema	[XMLSCHEMA1]
soap12	http://schemas.xmlsoap.org/wsdl/soap12/	[WSDLSOAP]
wsdl	http://schemas.xmlsoap.org/wsdl	[WSDL]

~~2.1-12.2.2~~ ~~2.2.2~~ Methods

The following table summarizes the set of method definitions that are defined by this specification.

Report Management: ReportService2010 methods are defined in detail in [MSDN-RS2010Methods].

Method	Description
CancelJob	Cancels the execution of a job.
ChangeSubscriptionOwner	Changes the owner of a subscription.
CreateCacheRefreshPlan	Creates a cache refresh plan for an item. This method applies to the Report and Dataset item types.
CreateCatalogItem	Adds a new item to a report server database or SharePoint library. This method applies to the Report , Model , Dataset , Component , Resource , and DataSource item types.
CreateDataDrivenSubscription	Creates a data-driven subscription for a specified item. This method applies to the Report item type.
CreateDataSource	Creates a new data source in a report server database or SharePoint library.
CreateFolder	Adds a folder to the report server database or SharePoint library.
CreateItemHistorySnapshot	Generates an item history snapshot of a specified catalog item. This method applies to the Report item type.
CreateLinkedItem	Adds a new linked item to the report server database.
CreateReportEditSession	Creates a new report edit session in the report server database.
CreateRole	Adds a new role to the report server database. This method applies only to native mode.
CreateSchedule	Creates a new shared schedule.
CreateSubscription	Creates a subscription for the specified item in the report server database or SharePoint library. This method applies to the Report item type.
DeleteCacheRefreshPlan	Deletes a cache refresh plan.
DeleteItem	Deletes a specified item from a report server database or SharePoint library. This method applies to all item types.
DeleteItemHistorySnapshot	Deletes an individual item history snapshot for a specified catalog item. If errors occur, the item history snapshot is not deleted. This method

Method	Description
	applies to the Report item type.
DeleteRole	Deletes a specified role from the report server database. This method applies only to native mode.
DeleteSchedule	Deletes a shared schedule from the report server database or SharePoint library.
DeleteSubscription	Deletes a subscription from the report server database.
DisableDataSource	Disables a data source that is enabled.
DisableSubscription<2>	Disables a subscription that is enabled.
EnableDataSource	Enables a data source that is disabled.
EnableSubscription<3>	Enables a subscription that is disabled.
FindItems	Returns items from a report server database or SharePoint library that match the search criteria.
FireEvent	Raises an event based on the supplied parameters.
FlushCache	Invalidates the cache for an item. This method applies to the Report and Dataset item types.
GenerateModel	Generates a default model on top of a shared data source.
GetCacheOptions	Returns the cache configuration for an item and the settings that describe when the cached copy of the item expires. This method applies to the Report and Dataset item types.
GetCacheRefreshPlanProperties	Returns the properties of the specified cache refresh plan.
GetDataDrivenSubscriptionProperties	Returns the properties of a data-driven subscription.
GetDataSourceContents	Returns the contents of a data source.
GetExecutionOptions	Returns the execution option and associated settings for an individual item. This method applies to the Report item type.
GetExtensionSettings	Returns a list of settings for a given extension.
GetItemDataSourcePrompts	Returns the data source prompts for a specified item. This method applies to the Report and Model item types.
GetItemDataSources	Returns the data sources for an item in the catalog.
GetItemDefinition	Retrieves the definition or content for an item. This method applies to the Report , Model , Dataset , Component , Resource , and DataSource item types.
GetItemHistoryLimit	Returns the item history snapshot limit for a specified catalog item. This method applies to the Report item type.
GetItemHistoryOptions	Returns the item history snapshot option and properties that are generated for a catalog item. This method applies to the Report item type.
GetItemLink	Returns the name of the item whose item definition is used for the specified linked item. This method applies to the Report item type.
GetItemParameters	Returns parameter properties for a specified item. This method can also

Method	Description
	be used to validate parameter values against parameters for a specified item.
GetItemReferences	Returns a list of catalog item references that are associated with an item. This method applies to the Report and Dataset item types.
GetItemType	Retrieves the type of an item in a report server database or SharePoint library, if the item exists.
GetModelItemPermissions	Retrieves the user permissions that are associated with the model item.
GetModelItemPolicies	Retrieves the policies that are associated with a model item.
GetPermissions	Returns the user permissions that are associated with a particular item in a report server database or SharePoint library.
GetPolicies	Returns the policies that are associated with a particular item in a report server database or SharePoint library.
GetProperties	Returns the value of one or more properties of an item in a report server database or SharePoint library. This method applies to all item types.
GetReportServerConfigInfo	Returns information on the connected report server instance or all the report server instances in a scale-out deployment.
GetRoleProperties	Returns role information and a collection of associated tasks.
GetScheduleProperties	Returns the properties of a shared schedule.
GetSubscriptionProperties	Returns the properties of a specified subscription.
GetSystemPermissions	Retrieves the system permissions of the current user. This method applies only to native mode.
GetSystemPolicies	Returns the system policies, including groups and associated roles. This method applies only to native mode.
GetSystemProperties	Returns the value of one or more system properties.
GetUserModel	Returns the semantic piece of a model for the current user.
GetUserSettings<4>	Returns the value of one or more user properties.
InheritModelItemParentSecurity	Deletes the policies that are associated with a model item and causes the model item to inherit the policies from its parent.
InheritParentSecurity	Deletes the policies that are associated with an item. As a result, the item inherits the policies from its parent. This method applies to all item types.
IsSSLRequired	Returns a Boolean value that indicates whether the Secure Socket Layer (SSL) protocol is required to use this end point.
ListCacheRefreshPlans	Returns a list of the cache refresh plans that are associated with a catalog item.
ListChildren	Returns a list of the children of a specified folder.
ListDatabaseCredentialRetrievalOptions	Returns a list of supported credential retrieval options.
ListDependentItems	Returns a list of catalog items that reference a specified catalog item.

Method	Description
ListEvents	Returns a list of events that are supported by the report server.
ListExecutionSettings	Returns a list of supported execution settings.
ListExtensions	Returns a list of extensions that are configured for a given extension type.
ListExtensionTypes	Returns a list of supported extension types.
ListItemHistory	Returns a list of item history snapshots and their properties for a specified catalog item. This method applies to the Report item type.
ListItemTypes	Returns a list of supported catalog item types.
ListJobActions	Returns a list of supported job actions.
ListJobs	Returns a list of jobs that are running on the report server.
ListJobStates	Returns a list of supported job states.
ListJobTypes	Returns a list of supported job types.
ListModelDrillthroughReports	Lists drillthrough reports that are associated with an entity in a model.
ListModelItemChildren	Returns an array of model item child elements.
ListModelItemTypes	Returns a list of supported model item types.
ListModelPerspectives	Lists models and perspectives that are available to the user.
ListMySubscriptions	Retrieves a list of subscriptions that have been created by the current user of the report server or SharePoint site for the given catalog item.
ListParameterStates	Returns a list of supported parameter states.
ListParameterTypes	Returns a list of supported parameter types.
ListParents	Retrieves the parent items for the given item.
ListRoles	Returns the names and descriptions of roles for a given SharePoint site.
ListScheduledItems	Returns a list of items that are associated with a shared schedule.
ListSchedules	Returns a list of all shared schedules in the report server database or for a given SharePoint site.
ListScheduleStates	Returns a list of supported schedule states.
ListSecurityScopes	Returns a list of supported security scopes.
ListSubscriptions	Retrieves a list of subscriptions that have been created for a given item. This method applies to the Report item type.
ListSubscriptionsUsingDataSource	Returns a list of subscriptions that are associated with a given data source.
ListTasks	Returns the tasks that are managed by the report server.
Logoff	Logs off the current user who is making web service requests. This method applies only to native mode.
LogonUser	Logs on a user and authenticates a user request to the Report Server web service. This method applies only to native mode.

Method	Description
MoveItem	Moves and/or renames an item. This method applies to all item types.
PauseSchedule	Pauses the execution of a given schedule.
PrepareQuery	Returns a dataset that contains the fields that are retrieved by the delivery query for a data-driven subscription.
RegenerateModel	Updates an existing model based on changes to the data source schema.
RemoveAllModelItemPolicies	Deletes all policies that are associated with model items in the specified model.
ResumeSchedule	Resumes a shared schedule that has been paused.
SetCacheOptions	Configures an item to be cached and provides settings that specify when the cached copy of the item expires. This method applies to the Report and Dataset item types.
SetCacheRefreshPlanProperties	Sets the properties of a cache refresh plan.
SetDataDrivenSubscriptionProperties	Sets the properties of a data-driven subscription.
SetDataSourceContents	Sets the connection properties that are associated with a ReportService2010.DataSource object [MSDN-RS2010Methods].
SetExecutionOptions	Sets execution options and associated execution properties for a specified item. This method applies to the Report item type.
SetItemDataSources	Sets the data sources for an item in a report server database or SharePoint library. This method applies to the Report and Model item types.
SetItemDefinition	Sets the definition or content for a specified item. This method applies to the Report , Model , Dataset , Component , Resource , and DataSource item types.
SetItemHistoryLimit	Specifies the number of snapshots of an item that the report server retains. This method applies to the Report item type.
SetItemHistoryOptions	Sets item history options that specify when an item history snapshot is created for a specified catalog item. This method applies to the Report item type.
SetItemLink	Specifies the catalog item that is used for the item definition of an existing linked item. This method applies to the Report item type.
SetItemParameters	Sets parameter properties for a specified item.
SetItemReferences	Sets the catalog items that are associated with an item. This method applies to the Report and Dataset item types.
SetModelDrillthroughReports	Associates a set of drillthrough reports together with a model.
SetModelItemPolicies	Sets security policies on a model item.
SetPolicies	Sets the policies that are associated with a specified item.
SetProperties	Sets one or more properties of a specified item.
SetRoleProperties	Sets role properties and associates a collection of tasks with a specified role. This method applies only to native mode.

Method	Description
SetScheduleProperties	Sets the properties of a shared schedule.
SetSubscriptionProperties	Sets the properties of a subscription.
SetSystemPolicies	Sets the system policy that defines groups and associated roles. This method applies only to native mode.
SetSystemProperties	Sets one or more system properties for the report server or SharePoint farm.
SetUserSettings<5>	Sets one or more user properties.
TestConnectForDataSourceDefinition	Tests the connection for a data source. This method supports the direct testing of the data source.
TestConnectForItemDataSource	Tests the connection for a data source. This method supports the testing of published data sources that are used by reports or models, and shared data sources. This method applies to the Report , Model , and Dataset item types.
UpdateItemExecutionSnapshot	Generates an item execution snapshot for a specified item. This method applies to the Report item type.
ValidateExtensionSettings	Validates Reporting Services extension settings.

~~2.1.22.2.3~~ ~~2.2.3~~ Types

The following table summarizes the set of type definitions that are defined by this specification.

Report Management: ReportService2010 types are defined in detail in [MSDN-RSWS2010].

Type	Description
ActiveState	Represents information about the active state of a subscription. A ReportService2010.ActiveState object [MSDN-RS2010Methods] is returned by methods that query subscription properties.
BooleanOperatorEnum	Describes the logical operators that connect search conditions in a report server database or SharePoint library search.
CacheRefreshPlan	Represents a cache refresh plan.
CacheRefreshPlanState	Contains properties that indicate the state of a cache refresh plan.
CatalogItem	Represents an item in a report server database or SharePoint library.
ConditionEnum	Describes the type of comparison to perform between a SearchCondition object and the properties and values of items in the report server database or SharePoint library.
CredentialRetrievalEnum	Describes the credential retrieval settings for a data source.
DailyRecurrence	Represents the intervals at which a scheduled report runs. Intervals are specified in days.
DataRetrievalPlan	Represents settings that are required to retrieve data from the delivery query for data-driven subscriptions.
DataSetDefinition	Represents information about a set of data to display in a report.

Type	Description
DataSource	Represents a data source in a report server database or SharePoint library.
DataSourceCredentials	Represents data source credentials.
DataSourceDefinition	Represents a data source definition.
DataSourceDefinitionOrReference	Represents a data source definition or a reference to a shared data source.
DataSourcePrompt	Represents the name of a data source and the prompt to display to a user.
DataSourceReference	Represents a reference to a shared data source.
DaysOfWeekSelector	Represents the days of the week on which a scheduled report runs.
DrillthroughType	Specifies the type of a drillthrough report.
Event	Represents an event that is registered with the report server.
ExpirationDefinition	Represents the expiration setting for a cached report.
Extension	Represents an extension that is registered with the report server.
ExtensionParameter	Represents a setting for an extension.
ExtensionSettings	Represents a delivery extension and its configurable settings.
Field	Represents a field in a dataset of a report.
InvalidDataSourceReference	Represents a state in which a data source reference is no longer valid.
ItemHistorySnapshot	Represents an item history snapshot.
ItemNamespaceEnum	Describes the namespace identifier that is used to retrieve property information for an item in a report server database.
ItemParameter	Represents an item parameter.
ItemReference	Represents a reference to a catalog item.
ItemReferenceData	Represents the reference data to a catalog item.
Job	Represents a user or system job that a report server is actively processing.
MinuteRecurrence	Represents the intervals, in minutes, at which a scheduled report runs.
ModelCatalogItem	Provides a listing of all model perspectives for a model.
ModelDrillthroughReport	Provides information about a model drillthrough report.
ModelItem	Provides the semantic definition of the model item.
ModelPerspective	Provides information about a perspective of a model.
MonthlyDOWRecurrence	Represents the dates on which a scheduled report runs, typically by month, week, and day of the week.
MonthlyRecurrence	Represents the days of the month on which a scheduled report runs.
MonthsOfYearSelector	Represents the months of the year in which a scheduled report runs.
NoSchedule	Represents a state in which no schedules are associated with the execution or snapshot history settings of a report.

Type	Description
ParameterFieldReference	Represents a field name that a report server uses to retrieve the value for a parameter.
ParameterValue	Represents data that is used in parameterized reports or in delivery extension settings.
ParameterValueOrFieldReference	Represents a user-supplied value or a field name that represents the value of a parameter.
Policy	Represents groups and users and their roles, which are associated with items in a report server database or SharePoint library.
Property	Represents the properties of an item.
QueryDefinition	Represents a query that retrieves the data for a subscription.
RecurrencePattern	Represents the recurrence pattern of a schedule definition.
Role	Represents a role for use in Reporting Services security.
Schedule	Represents a schedule and its properties.
ScheduleDefinition	Represents a defined schedule.
ScheduleDefinitionOrReference	Represents a schedule definition or a reference to a shared schedule.
ScheduleExpiration	Represents a schedule that defines when a cached copy of a report expires.
ScheduleReference	Represents a reference to a shared schedule.
SearchCondition	Represents the properties of an item for which to search in the report server database or SharePoint library.
SensitivityEnum	Describes the sensitivity of a given type: kanatype, case, width, or accent.
Subscription	Represents a subscription.
SYSTEMTIME	Represents a date and time by using individual members for the month, day, year, weekday, hour, minute, second, and millisecond.
Task	Represents a task that is managed by the report server.
TimeExpiration	Represents the time, in minutes, that defines when a cached copy of a report expires.
TimeZoneInformation	Specifies information that is specific to the time zone.
ValidValue	Represents a valid value for an extension setting or report parameter.
Warning	Represents a list of errors or warnings that are returned when a report is published or processed.
WeeklyRecurrence	Represents the number of weeks and the days of the week on which a scheduled report runs.
WeekNumberEnum	Describes the week of the month in which a scheduled report runs.

~~2.1.32.2.4~~ ~~2.2.4~~ SOAP Headers

The following table summarizes the set of SOAP header definitions that are defined by this specification.

Report Management: ReportService2010 SOAP headers are defined in detail in [MSDN-RSWS2010].

SOAP header	Description
ItemNamespaceHeader	Represents the identifier that is used to retrieve item properties.
ServerInfoHeader	Represents information about the report server.
TrustedUserHeader	Not intended to be used directly from code. <26>

3 3—Appendix A: Full WSDL

For ease of implementation, the full WSDL is provided here.

4 ~~4~~ Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs~~+~~.

- ~~Microsoft SQL Server 2008 R2~~
- ~~Microsoft SQL Server 2012~~
- ~~Microsoft SQL Server 2014~~
- Microsoft SQL Server 2016

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> Section 2.1: Microsoft SQL Server supports both SOAP 1.1 [~~SOAP1.1WSDLSOAP1.1~~] and SOAP 1.2 [~~SOAP1.2WSDLSOAP~~].

<2> Section 2.2.2: The **DisableSubscription** method is not available in SQL Server 2008 R2, SQL Server 2012, and SQL Server 2014.

<3> Section 2.2.2: The **EnableSubscription** method is not available in SQL Server 2008 R2, SQL Server 2012, and SQL Server 2014.

<4> Section 2.2.2: The **GetUserSettings** method is not available in SQL Server 2008 R2, SQL Server 2012, and SQL Server 2014.

<5> Section 2.2.2: The **SetUserSettings** method is not available in SQL Server 2008 R2, SQL Server 2012, and SQL Server 2014.

<6> Section 2.2.4: **TrustedUserHeader** supports the SQL Server infrastructure.

5 ~~5~~—Change Tracking

~~No table of~~This section identifies changes is available. The that were made to this document is either new or has had no changes since its the last release. Changes are classified as New, Major, Minor, Editorial, or No change.

~~6~~The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
2.2.2 Methods	Added descriptions about GetUserSettings and SetUserSettings for SQL Server 2016..	Y	Content update.
2.2.2 Methods	Added descriptions for EnableSubscriptions, DisableSubscriptions, GetUserSettings, and SetUserSettings for SQL Server 2016.	Y	Content update.
3 Appendix A: Full WSDL	Updated WSDL for SQL Server 2016.	Y	Content update.
4 Appendix B: Product Behavior	Added SQL Server 2016 to the list of applicable products.	Y	Content update.
